Heavy quark masses with calibrated uncertainty

Friday 29 September 2017 11:15 (25 minutes)

A determination of the heavy quark masses from combinations of QCD sum rules of the moments of the vector current correlator calculated in perturbative QCD are presented. Only experimental data for the resonance below the continuum threshold are needed in our approach, while the continuum contribution is determined by requiring self-consistency between various sum rules and the zeroth moment. Special attention to the theory uncertainty is given.
