Lepton Flavour Violation at LHCb

Wednesday, 29 July 2020 17:01 (15 minutes)

Recent hints of lepton-universality violation in b->clnu and anomalies observed in b->sll transitions could imply the existence of lepton-flavour violating B decays. The LHCb experiment is well suited to search for these decays thanks to its large acceptance and trigger efficiency, as well as its excellent invariant mass resolution and particle identification capabilities. Recent results on searches for lepton-flavour violating decays from the LHCb experiment will be presented.
