Data Analyzed

M26 data (CERN 09/2009)

<http://www.iphc.cnrs.fr/Public-documentation.html>

Analysis-M26

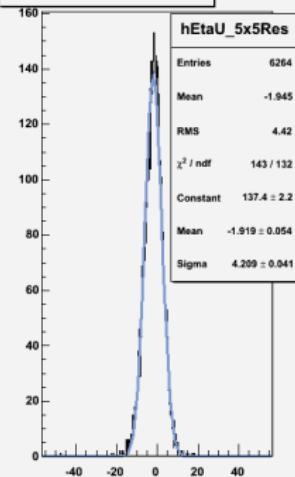

Run26520 - 0 degrees

Threshold Ref = 8 S/N
Threshold DUT = 8 S/N

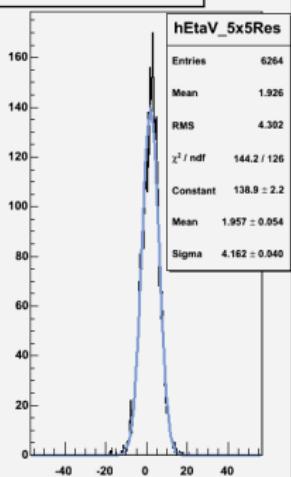

Efficiency - 99.1%

Corresponding to
 $\sigma_{x_t} = 1.9 \mu m$

Residual U (Eta5x5)

Residual V (Eta5x5)

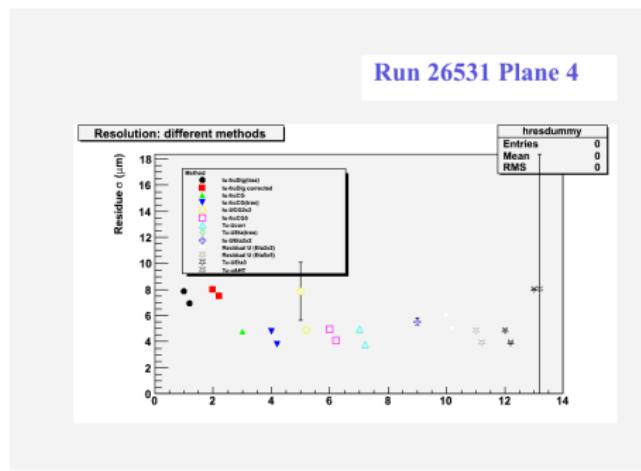

Analysis

Results of M26 at 45 degrees

Residue approximately $4 \mu m$ in both u and v

This corresponds to $\sigma_{x_t} = 2\mu m$

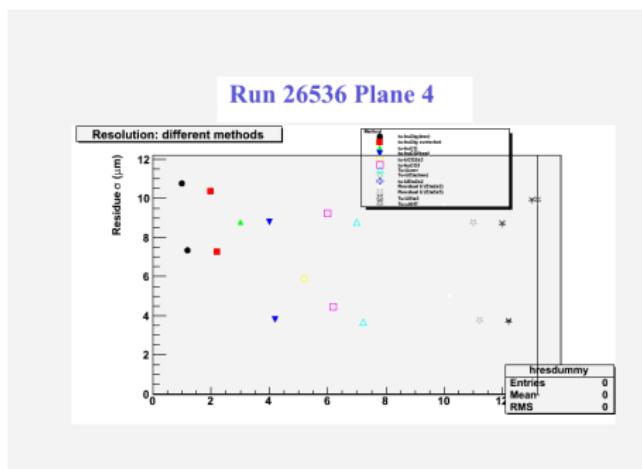

Analysis

Results of M26 at 58 degrees

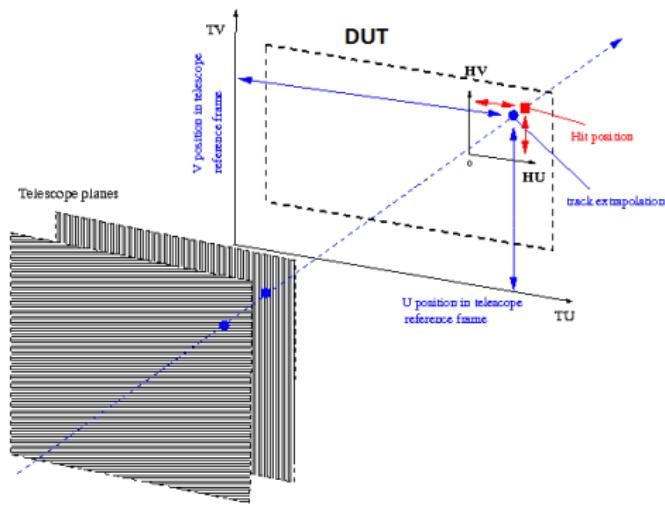

Alignment in U - problem with Alignment procedure or something physical?

Alignment

Align by minimizing distance between extrapolated track and measured hit in DUT plane

Alignment

Transform extrapolated track into DUT frame

$$\begin{pmatrix} u_t \\ v_t \\ w_t \end{pmatrix} = e_i \otimes e_j' \begin{pmatrix} x_t \\ y_t \\ z_t \end{pmatrix} + \begin{pmatrix} u_{off} \\ v_{off} \\ w_{off} \end{pmatrix}$$

Apply method of least squares

TAF software will minimize transformation parameters to align DUT
