

Scripting Workflows with the Application Hosting Environment

Stefan Zasada
University College London

Constructing workflows with the AHE

- By calling command line clients from Perl script complex workflows can be achieved
- Easily create chained or ensemble simulations
- For example jobs can be chained together:
 - ahe-prepare → prepare a new simulation for the first step
 - ahe-start → start the step
 - ahe-monitor → poll until step complete
 - ahe-getoutput → download output files
 - repeat for next step

Constructing a workflow

HIV-1 Protease

- Enzyme of HIV responsible for protein maturation
- Flexible Flaps open to provide access to active site¹
- Catalytic Asp Dyad cleaves peptide bond
- Example of Structure Assisted Drug Design – 8 FDA inhibitors

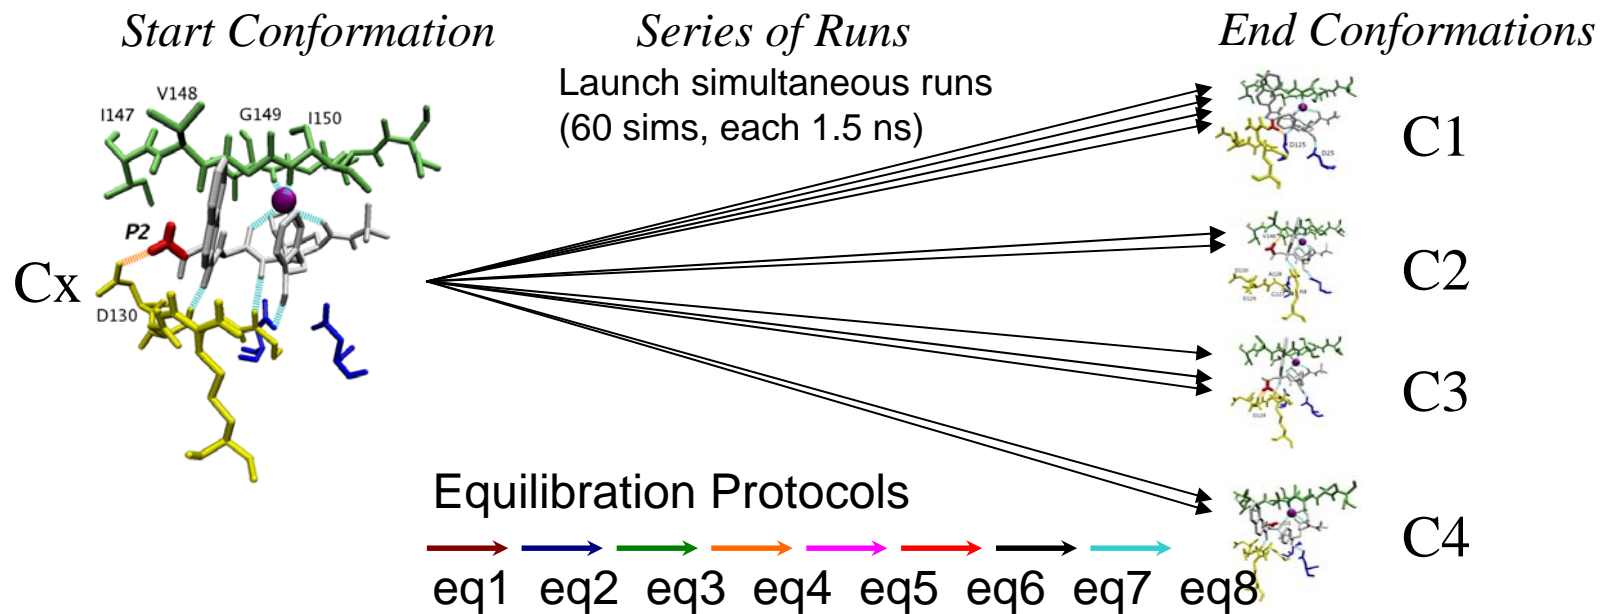

RMSD of existing crystal structures²

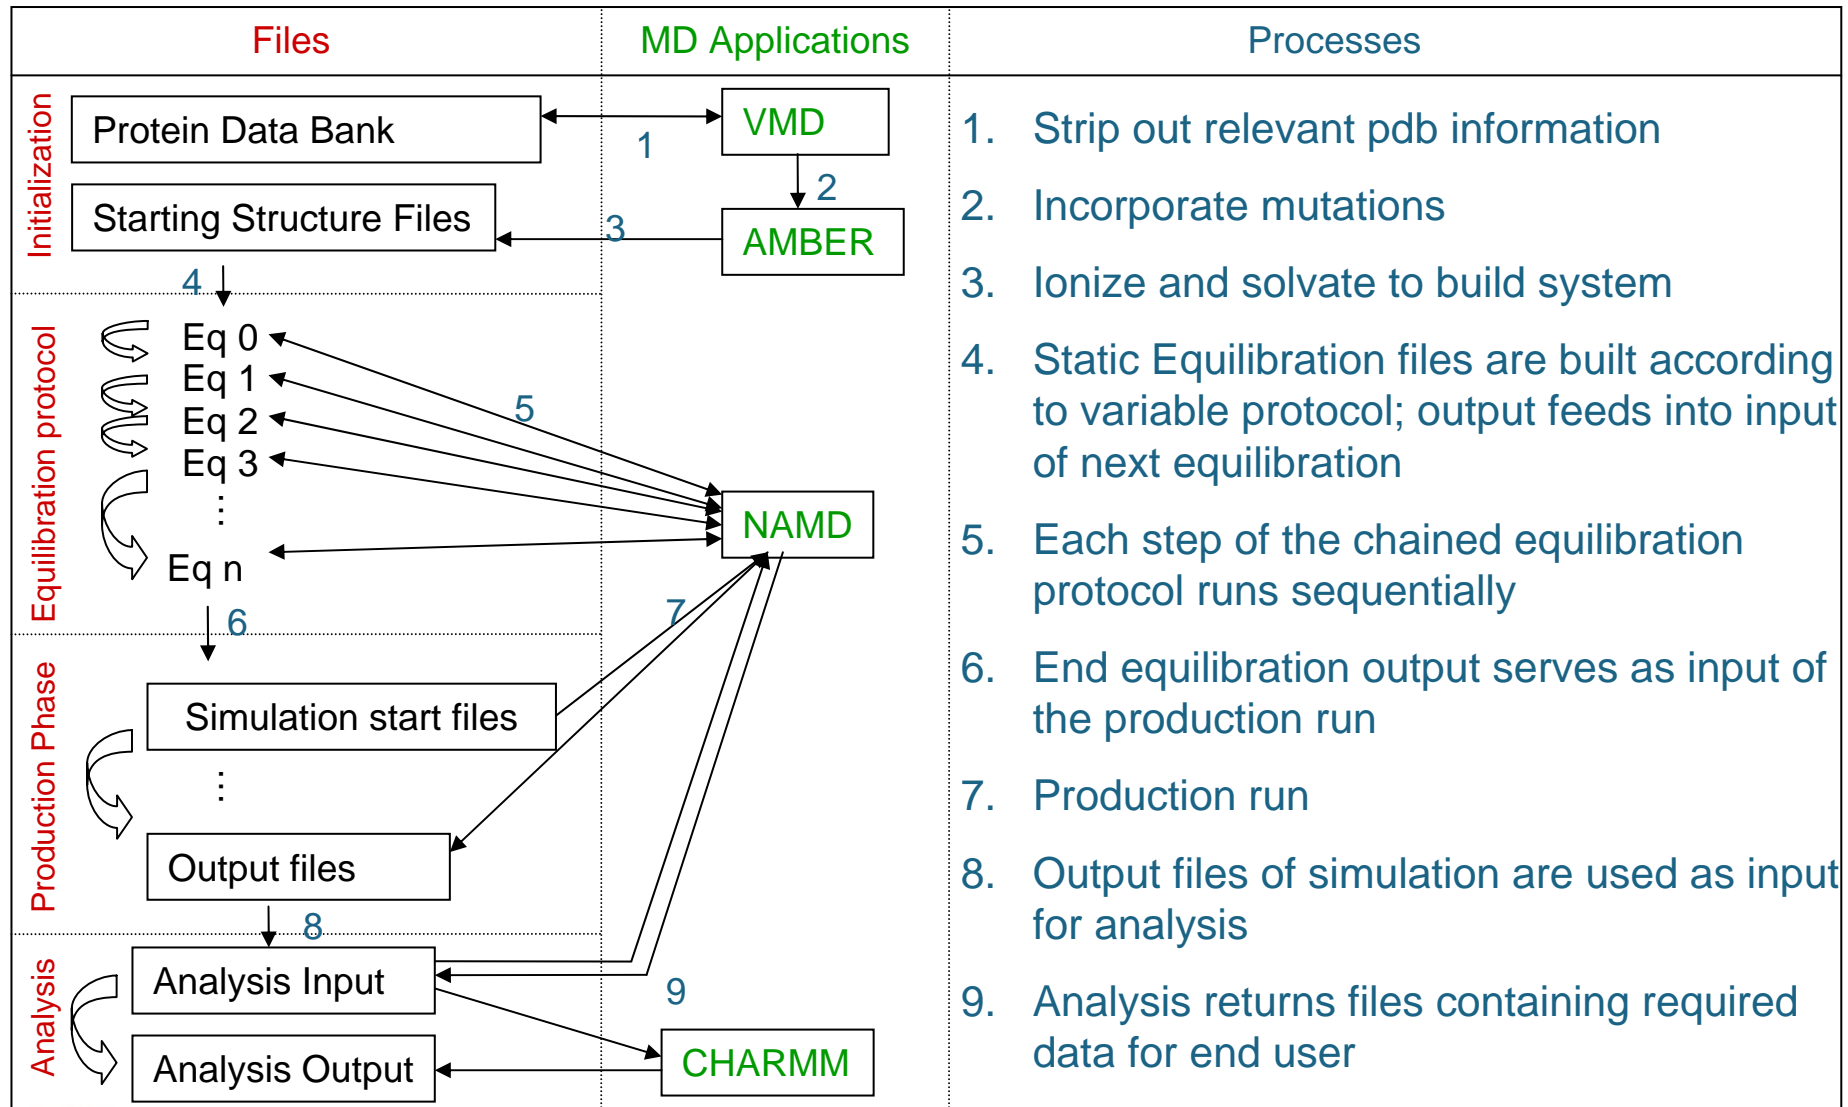

Computational Techniques

Ensemble MD is suited for HPC GRID

- Simulate each system many times from same starting position
- Each run has randomized atomic energies fitting a certain temperature
- Allows conformational sampling

Practical 2

Using Perl:

- Write script to automate preparing and starting a job, and staging files
- Write script to distribute jobs around a number of resources
- Write script to chain jobs, one after the other
