

GOCFL as a software approach to support standards-compliant OCFL extensions in the archival context

Starting point

The current generation of digital (long-term) archives is moving towards microservice architectures using cloud infrastructures.

Starting point

Assuming the management and administration system is in place, the Archival Information Package (AIP) must also meet modern requirements.

AIP – OCFL

Common AIP requirements face data, metadata, preservation information,
This presentation will focus on the benefits that are natively included in the
OCFL standard, such as:

OCFL Object
AIP

- **Completeness**, so that a repository can be rebuilt from the files it stores
- **Parsability**, both by humans and machines, to ensure content can be understood in the absence of original software
- **Robustness** against errors, corruption, and migration between storage technologies
- **Versioning**, so repositories can make changes to objects allowing their history to persist
- **Storage** diversity, to ensure content can be stored on diverse storage infrastructures including conventional filesystems and cloud object stores

Based on the OCFL standard, AIP features can be embedded in OCFL extensions. Following the OAIS standard, and based on experience of preservation needs and brain drain issues, our aim was to meet the following requirements:

OCFL Object
AIP

- Automatic recognition of technical metadata
- Minimal Semantic Metadata
- Safe path and filenames
- Migrations using versioning
- Self containment
- Self documentation
- ZIP container (with optional encryption)
- Reporting

OCFL - gocfl

Jürgen Enge (University Library Basel, juergen@info-age.net)
Version v1.0-beta.8

Usage:

```
gocfl [flags]
gocfl [command]
```

Available Commands:

```
add          adds new object to existing ocfl structure
completion  Generate the autocompletion script for the specified shell
create      creates a new ocfl structure with initial content of one object
display     show content of ocfl object in webbrowser
extract     extract version of ocfl content
extractmeta extract metadata from ocfl structure
help       Help about any command
init       initializes an empty ocfl structure
stat       statistics of an ocfl structure
update     update object in existing ocfl structure
validate   validates an ocfl structure
```

Flags:

```
--config string      config file (default is $HOME/.gocfl.toml)
-h, --help           help for gocfl
--log-file string    log output file (default is console)
--log-level string   log level (CRITICAL|ERROR|WARNING|NOTICE|INFO|DEBUG) (default "ERROR")
--s3-access-key-id string Access Key ID for S3 Buckets
--s3-endpoint string Endpoint for S3 Buckets
--s3-region string   Region for S3 Access
--s3-secret-access-key string Secret Access Key for S3 Buckets
--with-indexer       starts indexer as a local service
```

Use "gocfl [command] --help" for more information about a command.

gocfl is a cross-platform
command line tool for
creating OCFL standard
compliant objects.

OCFL - gocfl

gocfl allows:

- Multi-Threading – I/O optimized (single read/write)
 - concurrent procedures for
 - checksums
 - encryption
 - compression
- Encryption – AES encryption using Google Tink (<https://developers.google.com/tink>)
- One step ZIP-File creation for single object storage roots
- Web Access to content
- Reporting (full report on website / excerpt as printable pdf)
- Internal documentation of extensions

OCFL – gocfl - extensions

Current gocfl extensions are:

- **Content subpath** (create subfolders for different purposes like metadata or payload)
- **Filesystem** (filesystem metadata)
- **Indexer** (technical metadata)
- **Direct Clean Path Layout** (safe and readable folder-/filenames within OCFL object)
- **Migration** (migration based on Pronom UID)
- **Thumbnail** (image/video/pdf thumbnails, audio spectrograms)
- **Metafile** (schema validated minimal semantic metadata)

OCFL – gocfl - files

Report

mediathek:FHNW-HGK-SNF_185436-b

Der vorliegende Report basiert auf der OCFL-Dokumentation des Datenpakets `subFS(zipFS(fsFile(osFSRW(C:/temp/test)/ExpJourney.zip))/mediathek_FHNW-HGK-SNF_185436-b)`. Er enthält einen Auszug der Metadaten, die im Zuge der Archivierung für jede der im Datenpaket enthaltenen Dateien generiert wurden.

This report is based on the OCFL documentation of the data package `subFS(zipFS(fsFile(osFSRW(C:/temp/test)/ExpJourney.zip))/mediathek_FHNW-HGK-SNF_185436-b)`. It contains an excerpt of the metadata generated in the course of archiving for each of the files contained in the data package.

Technology – Human – Design: Paradigms of Ubiquitous Computing - Journey

Hochschule für Gestaltung und Kunst FHNW Basel
IXDM Research Projects

Torpus, Jan
<mailto:info.ixdm.hgk@fhnw.ch>
2023-06-20

The research setting Journey focuses on human behavioral patterns and appropriation processes in unknown techno-social hybrid environments. We investigate and compare both perspectives: user experience and machine recognition of human behavior. To do so, we composed an interactive research setting of six separate spaces to stage paradigms of ubiComp such as: ubiquity, immediacy, invisibility, seamlessness/seamfullness and interconnectedness. By applying strategies and aesthetics from the media arts and by implementing technological sensor-actor systems, we created a measurable and debatable environment. It offers snippets of narratives that can be mentally combined and is carefully designed to enable test persons to fully engage and willingly suspend their disbelief. The bodily interference with the physical environment is intensified by an interactive garment that test persons put on before their journey. By doing so, they leave their familiar comfort zone and take on a new role in the narrative.

gocfl

GOCFL.

To achieve a system-independent, transportable Archival Information Package (AIP), the approach presented embeds semantic, technical and preservation metadata at the extension level of OCFL, rather than superimposing this type of data on top of OCFL.

Lessons learned

The use of cloud technologies such as object storage, microservices, etc. not only enables new technological solutions. They also greatly simplify collaboration by eliminating the need for centralized, monolithic development. The portable OCFL structure is an important milestone in this respect.

The core OCFL standards community has not yet seen the impact of the extensions in this form. As a result, the field is still very much uncharted. But the community is very interested.
