

# Event matching for LHCf and ATLAS data

LHCf Collaboration Meeting, Nagoya, 2023

# Table of contents

## **1. Introduction**

- motivation event matching for LHCf and ATLAS

## **2. Trigger system**

- explanation of ECR and L1ID used for event match

## **3. Event match**

- Detailed step event match

## **4. Confirmation**

- Offset bcid and time

## **5. Conclusion**

# Introduction

## ○ Motivation of joint analysis LHCf-ATLAS

1. Process by process analysis events can be performed

ATLAS : wide particle detection range ( $|\eta| < 5$ )

LHCf : forward area ( $|\eta| > 8.4$ )

$\eta$  : pseudorapidity

➔ It is possible to determine from which process the particles detected by LHCf are from.

2. Contribute to the development of hadronic interaction model

# Trigger system

## ○ Flow of recording event data

1. Send L1 to ATLAS → Record event ATLAS
2. send L1A (0 or 1) to LHCf side

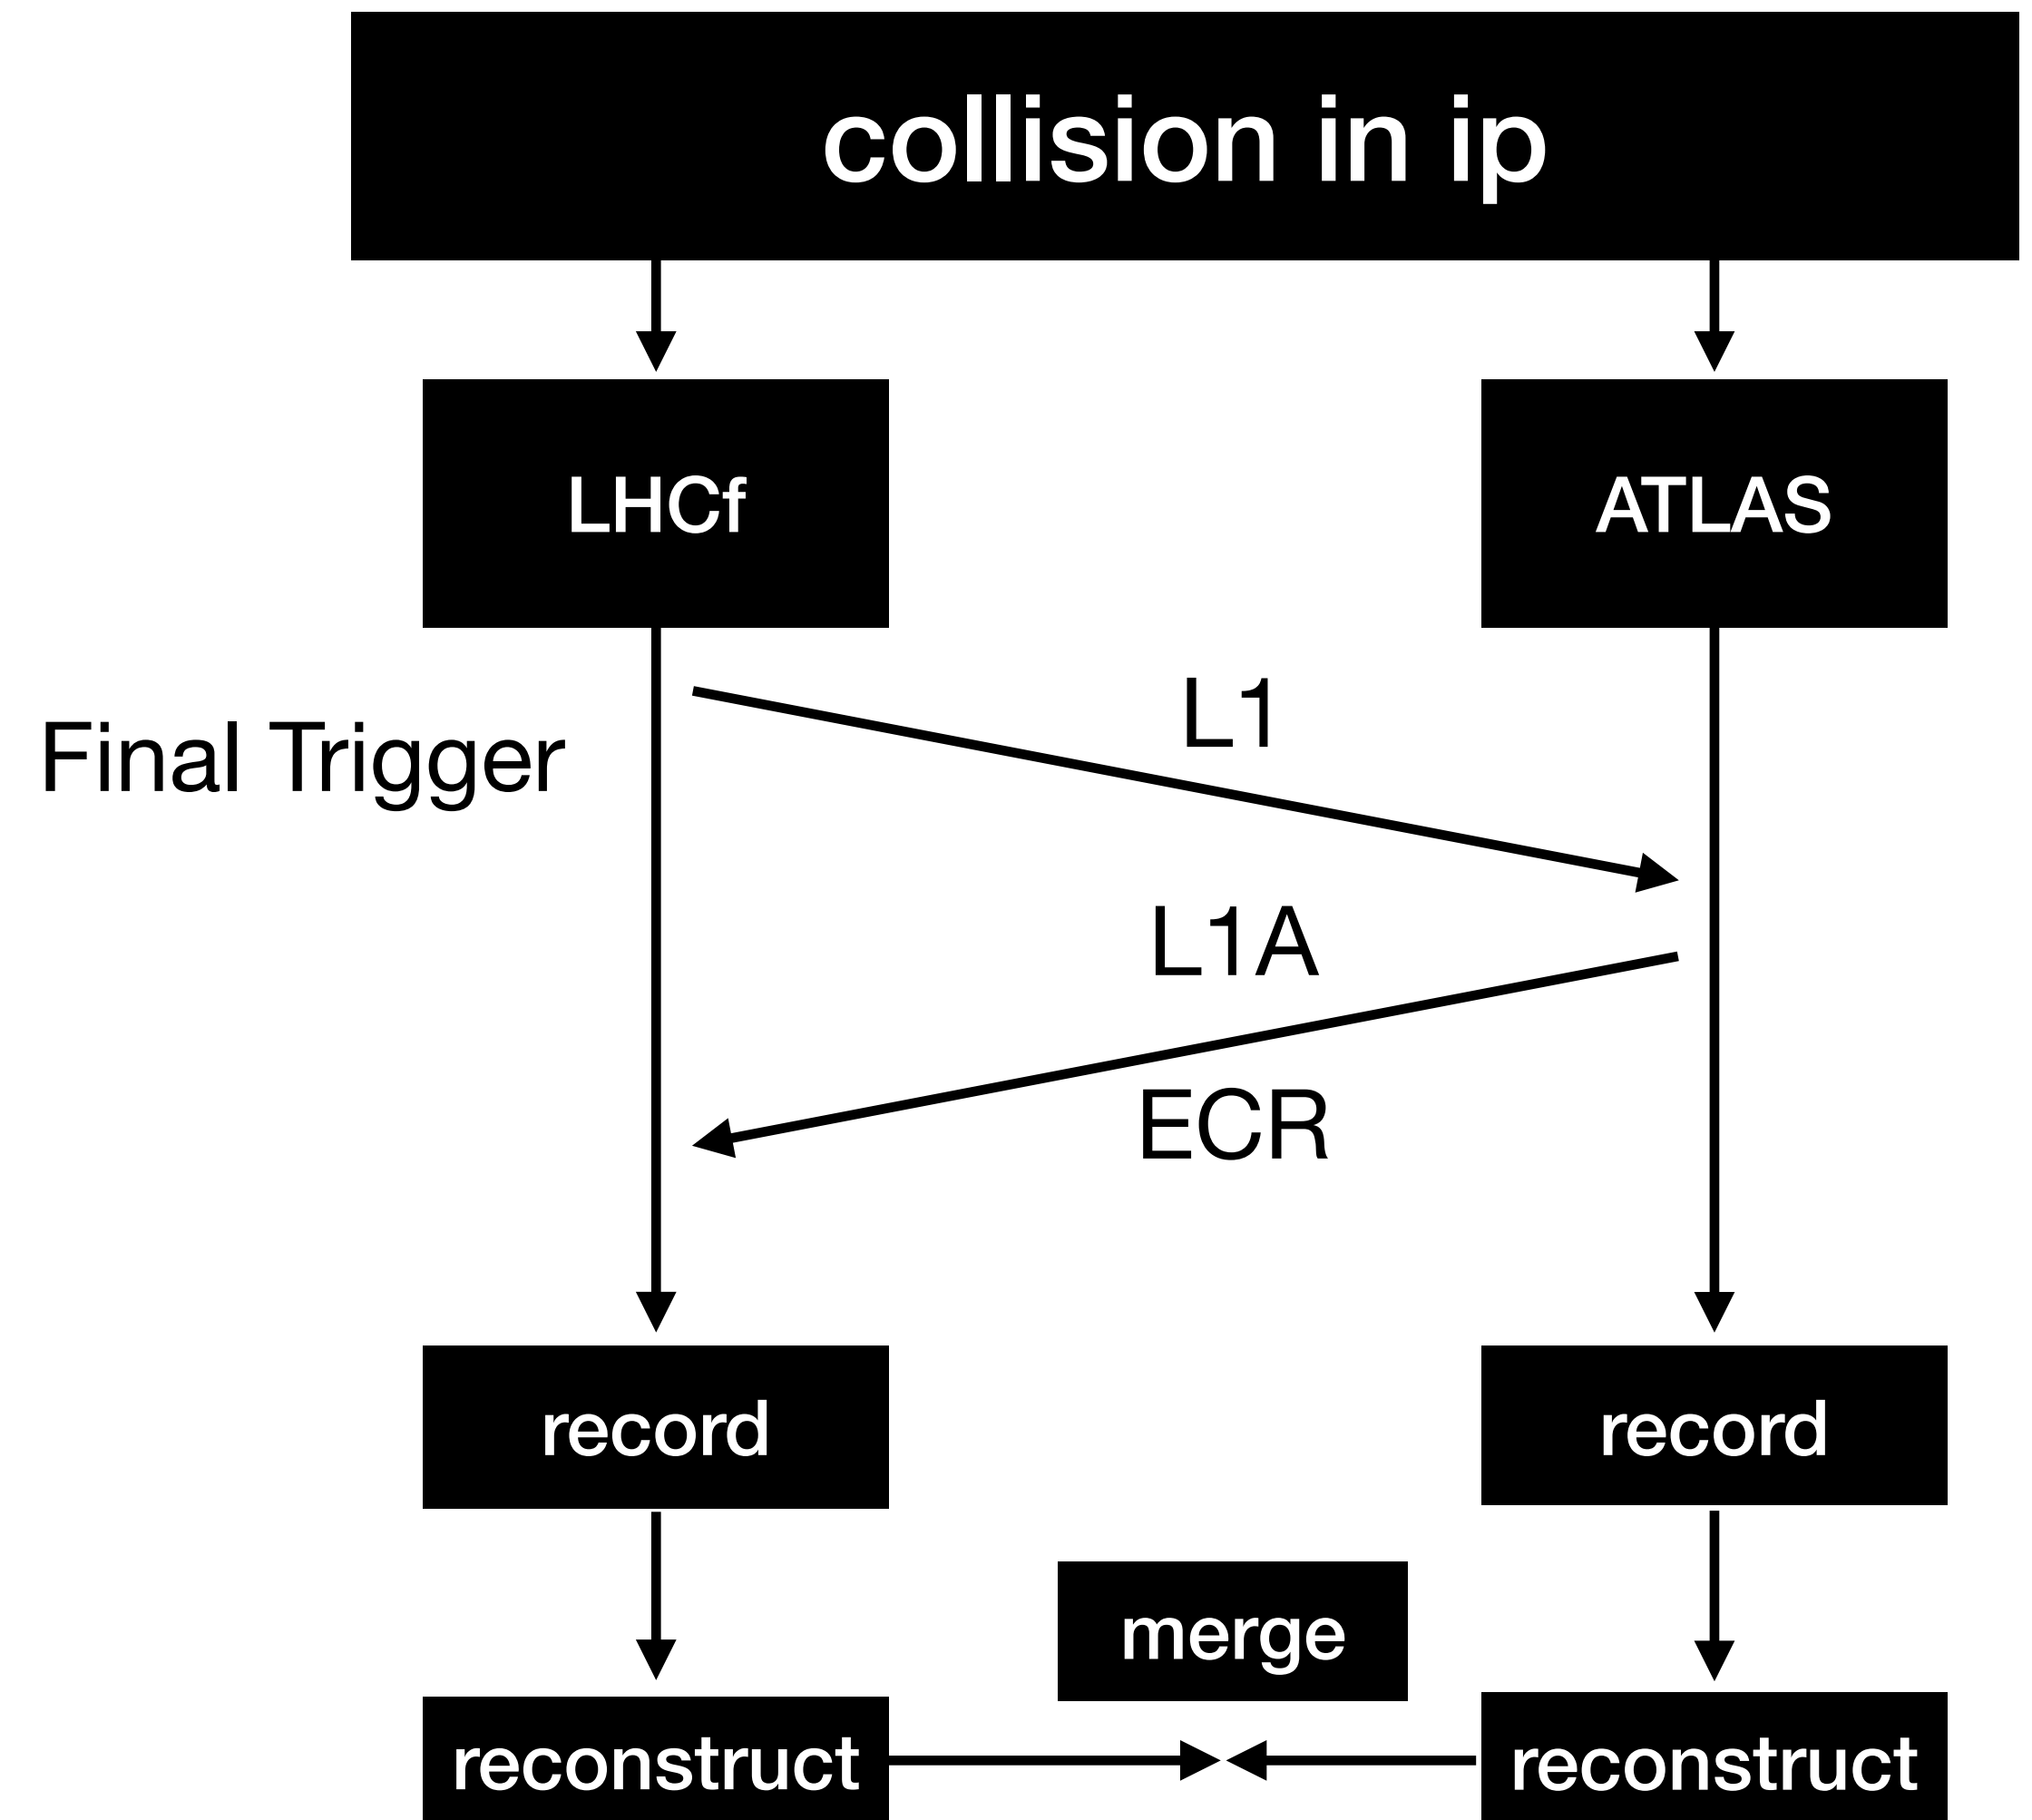

ATLAS data is **not** lined up in time order

( L1ID : Recording number of L1A  
ECR : Reset L1ID by every 4 sec  
LumiBlock(LB): data block of ATLAS )

➔ **Using for event matching**

ECR is recorded separately in LHCf and ATLAS, so there is offset.

# Event matching

- Data : Op2022, reduction data
  - Handling data easier than rec.
  - Save as root file.

```

ATLAS

# Event matching

## ○ Detailed step event match

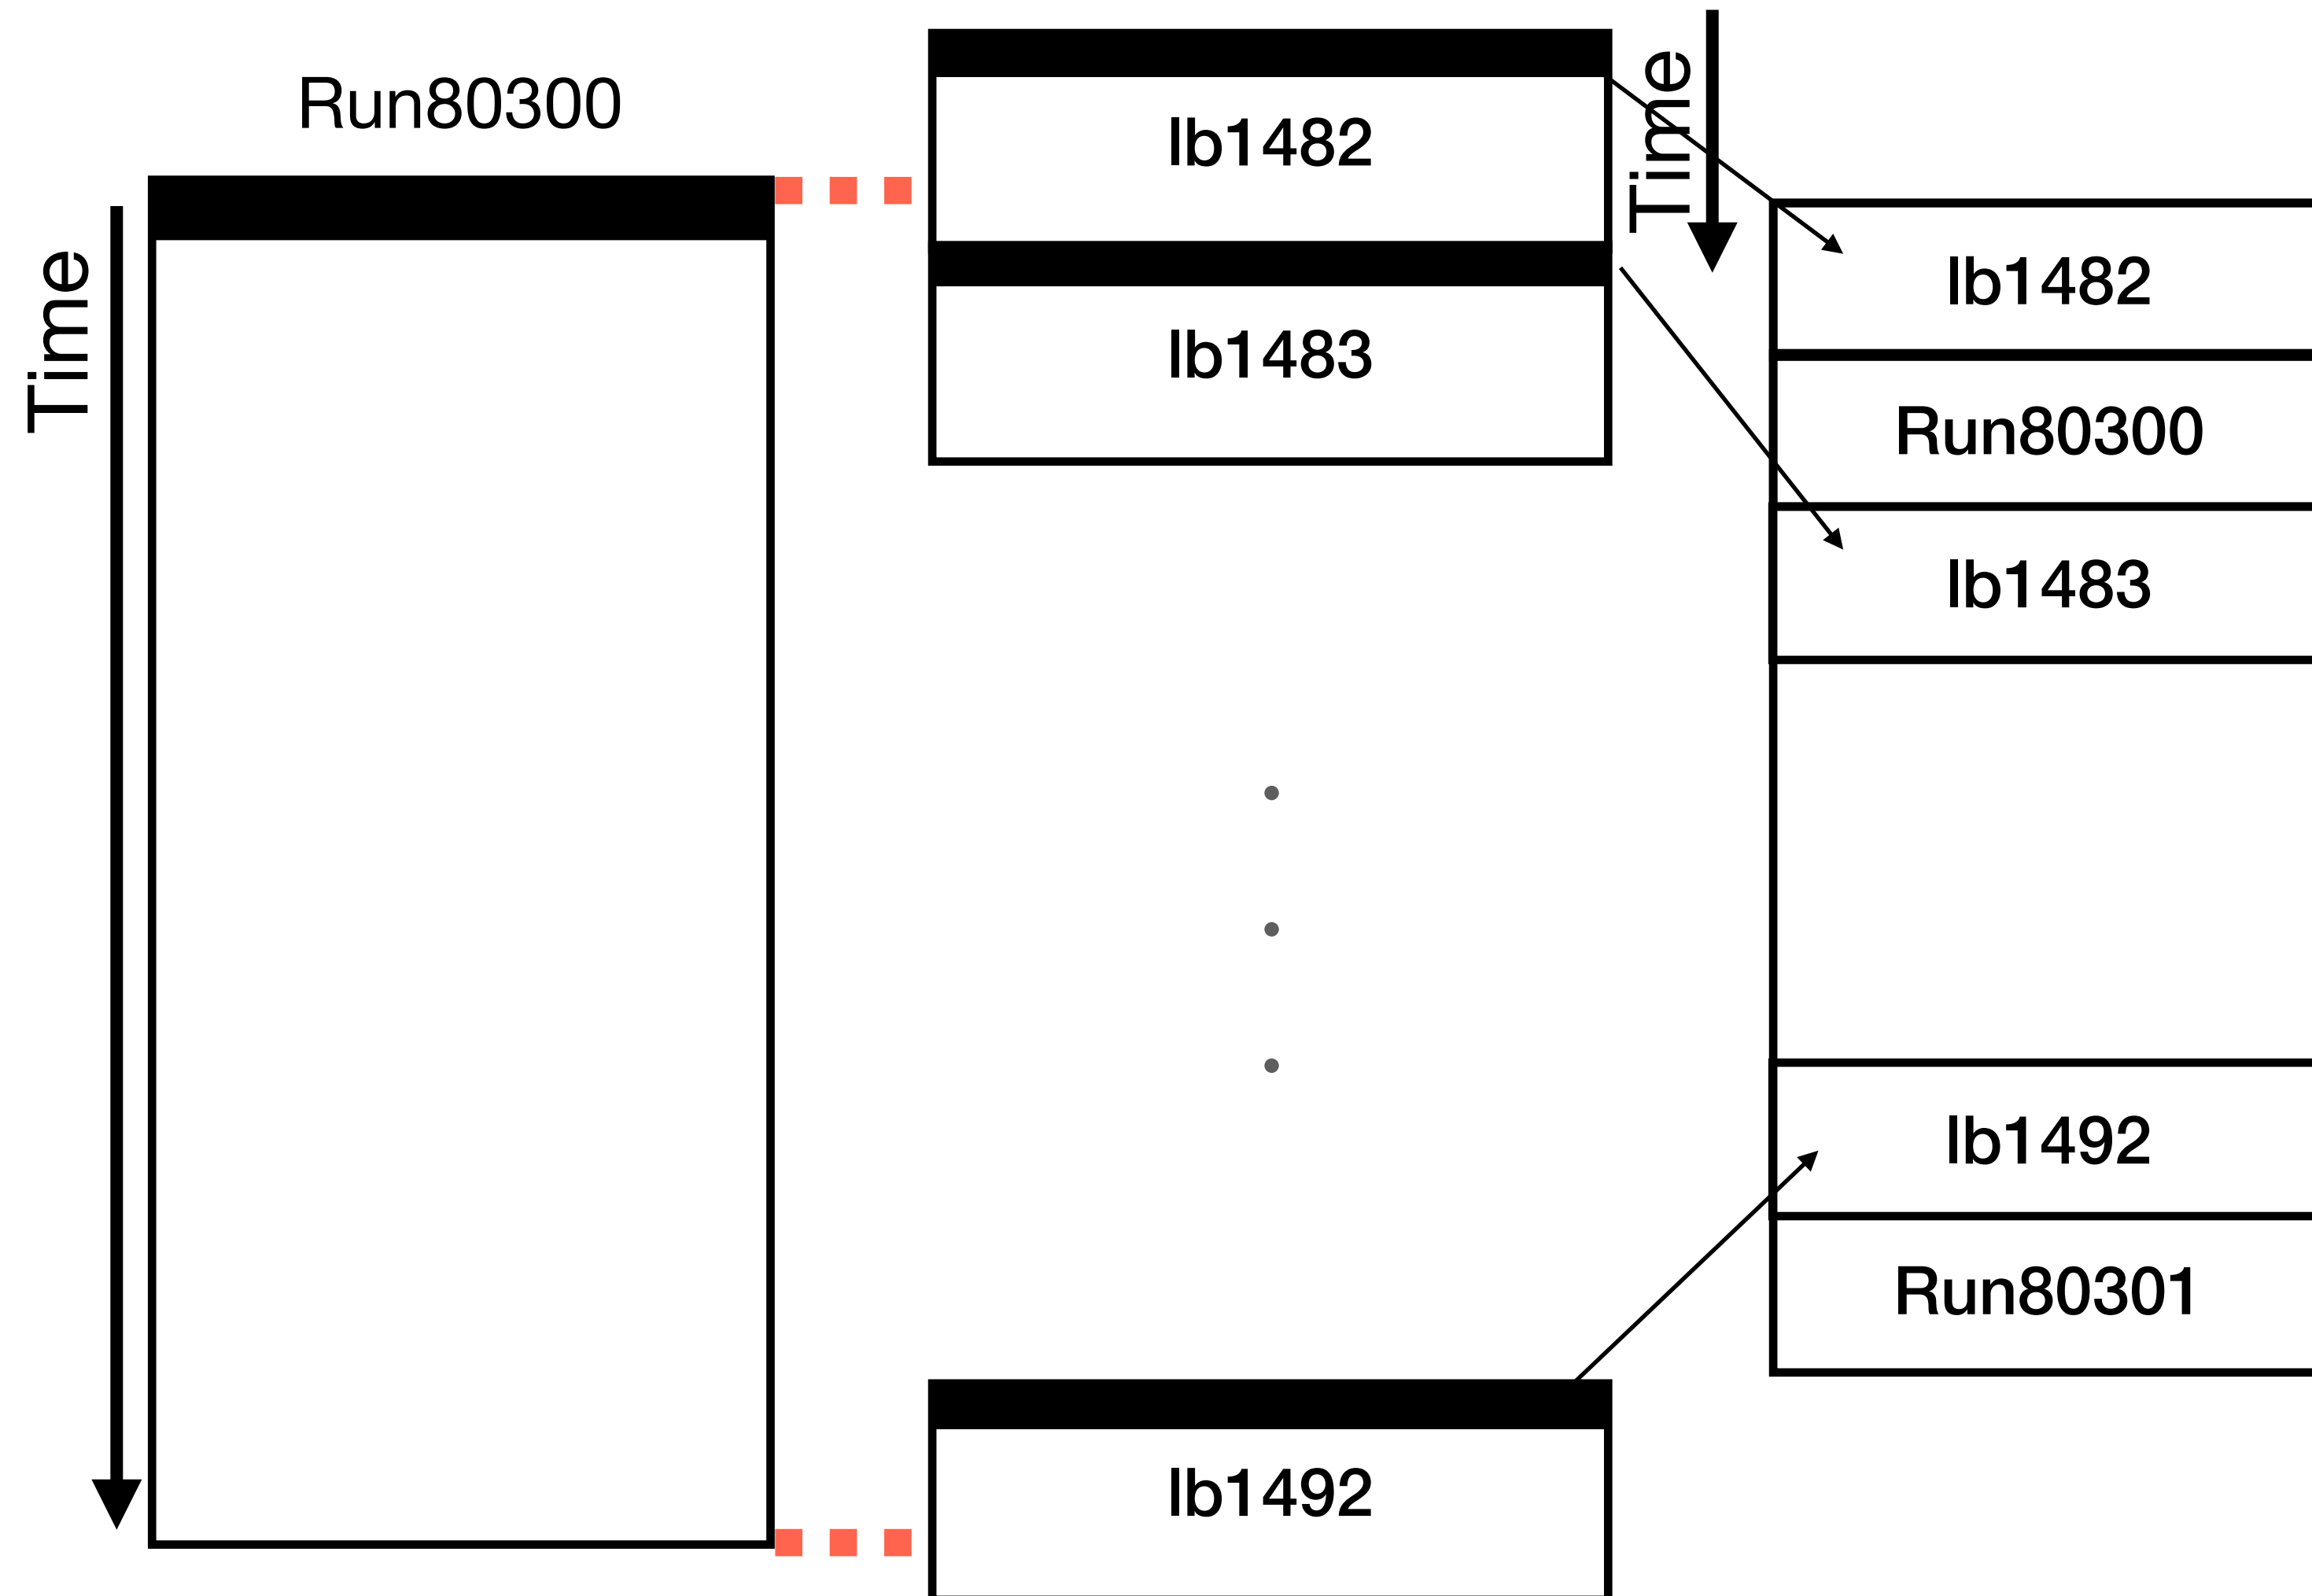

1. Make correspondence table between Run and LB (Run-LB table)
  - Previous table shows LHCf time with minute precision
  - Create a new seconds precision table
2. Calculate ECR offset and event match
  - Match using TimeStamp, L1ID for the run and corresponding LB
  - Check if the ECR offsets of the first and last matching event is equal in the time-sorted lb match.
  - ECR offset is equal in lb → L1ID, ECR
  - ECR offset is not equal in lb → L1ID, TimeStamp
3. Check the offset of bcid,time

# Event matching

## ○ Run-LB table

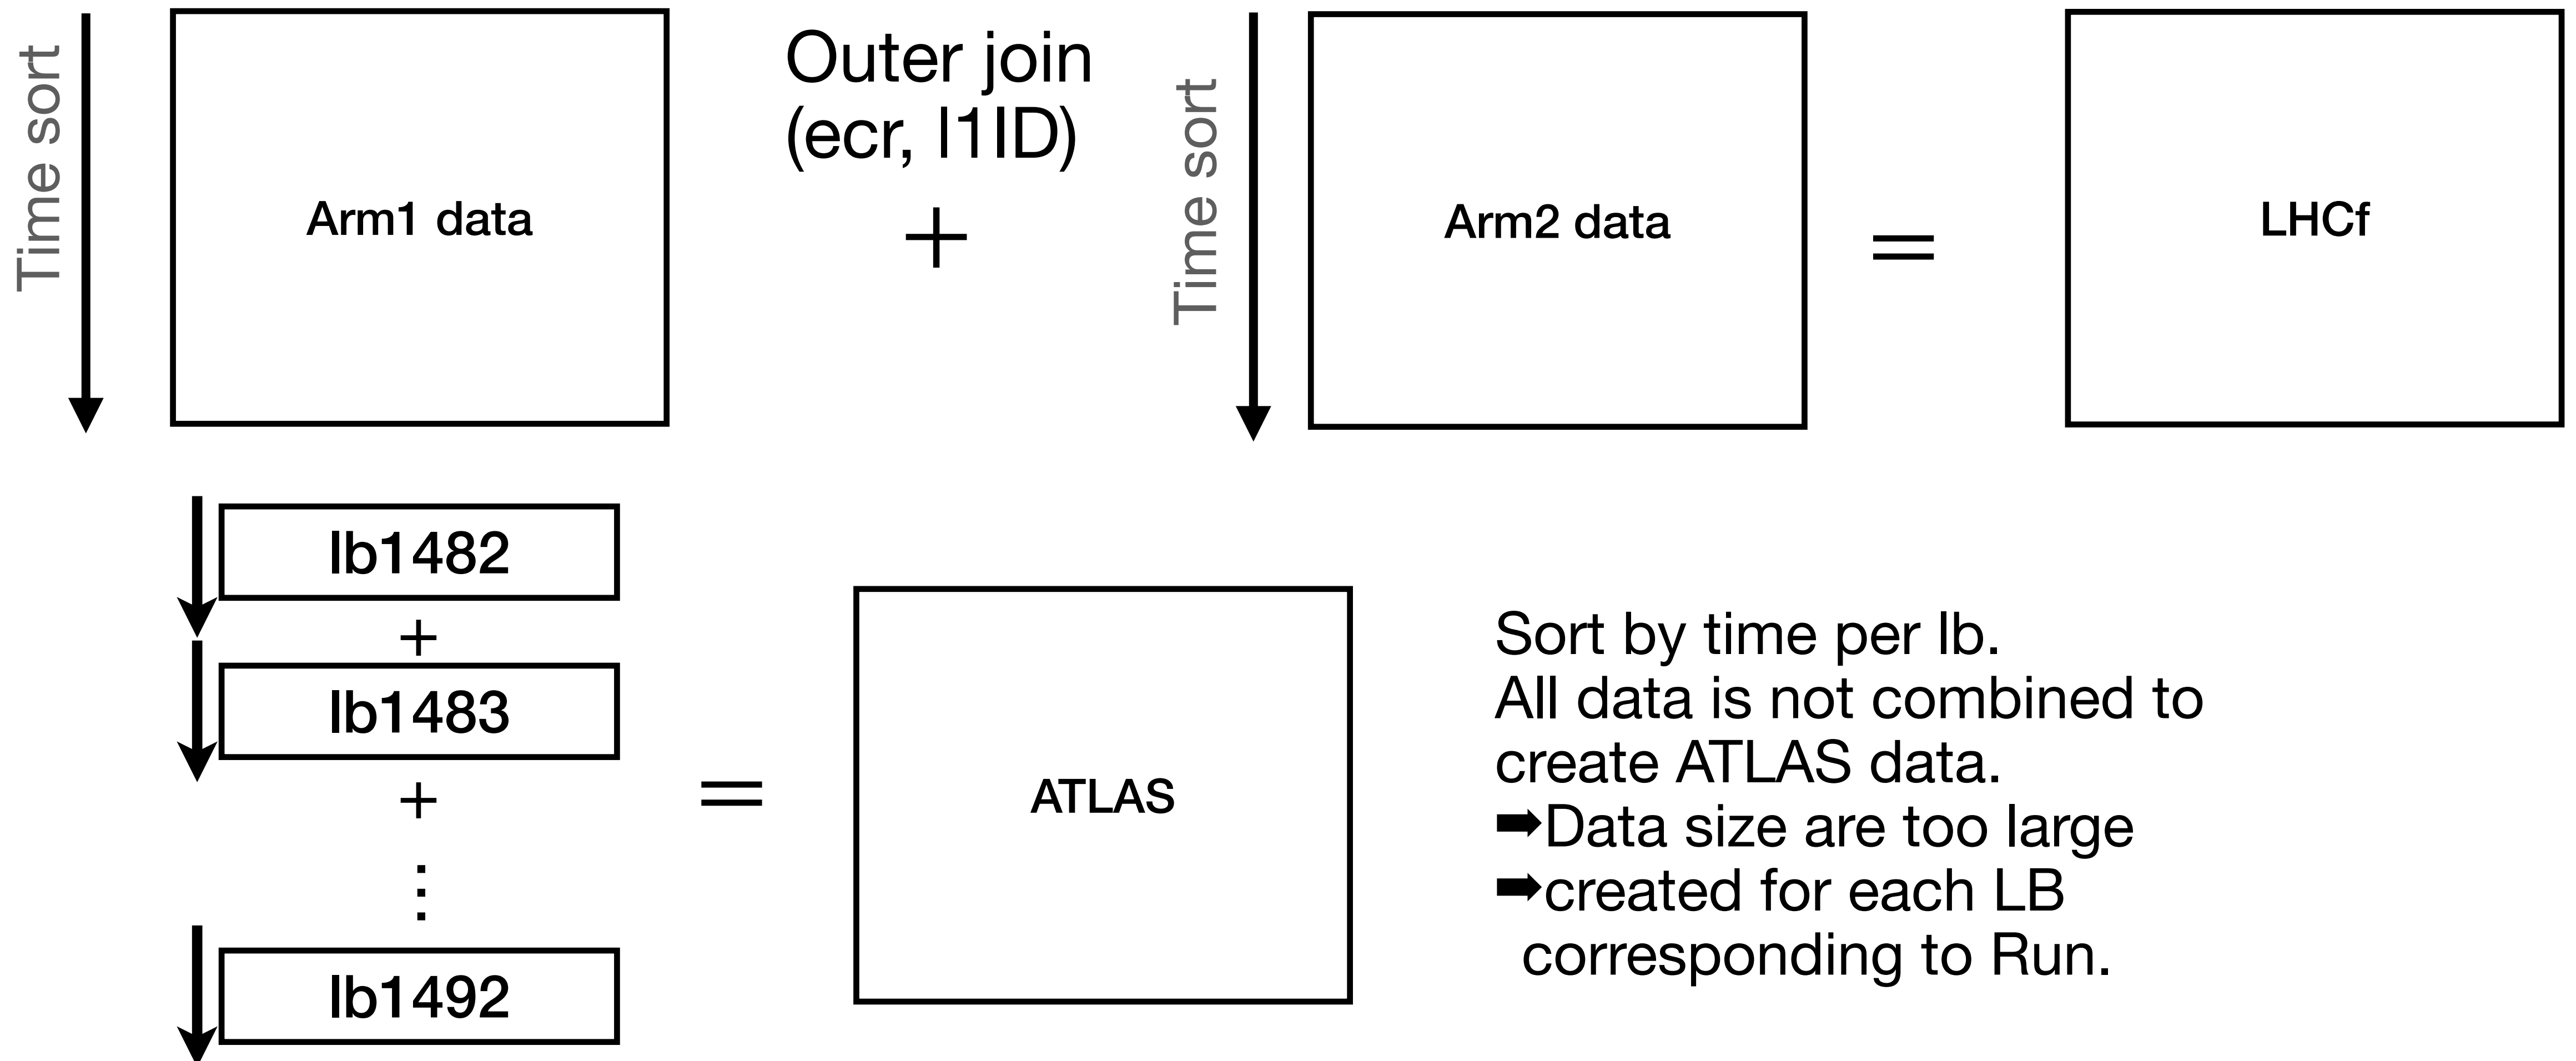

1. Get the event with the smallest value of Time in the data
2. Do this for each LB even for ATLAS data
3. Arrange 1 and 2 in order of Time

ex) Run80300 corresponds to LB1482~LB1492

# Event matching

## ○ Merge Arm1 and Arm2

# Event matching

## ○ ATLAS data

```

14 348232  
14 348233
```

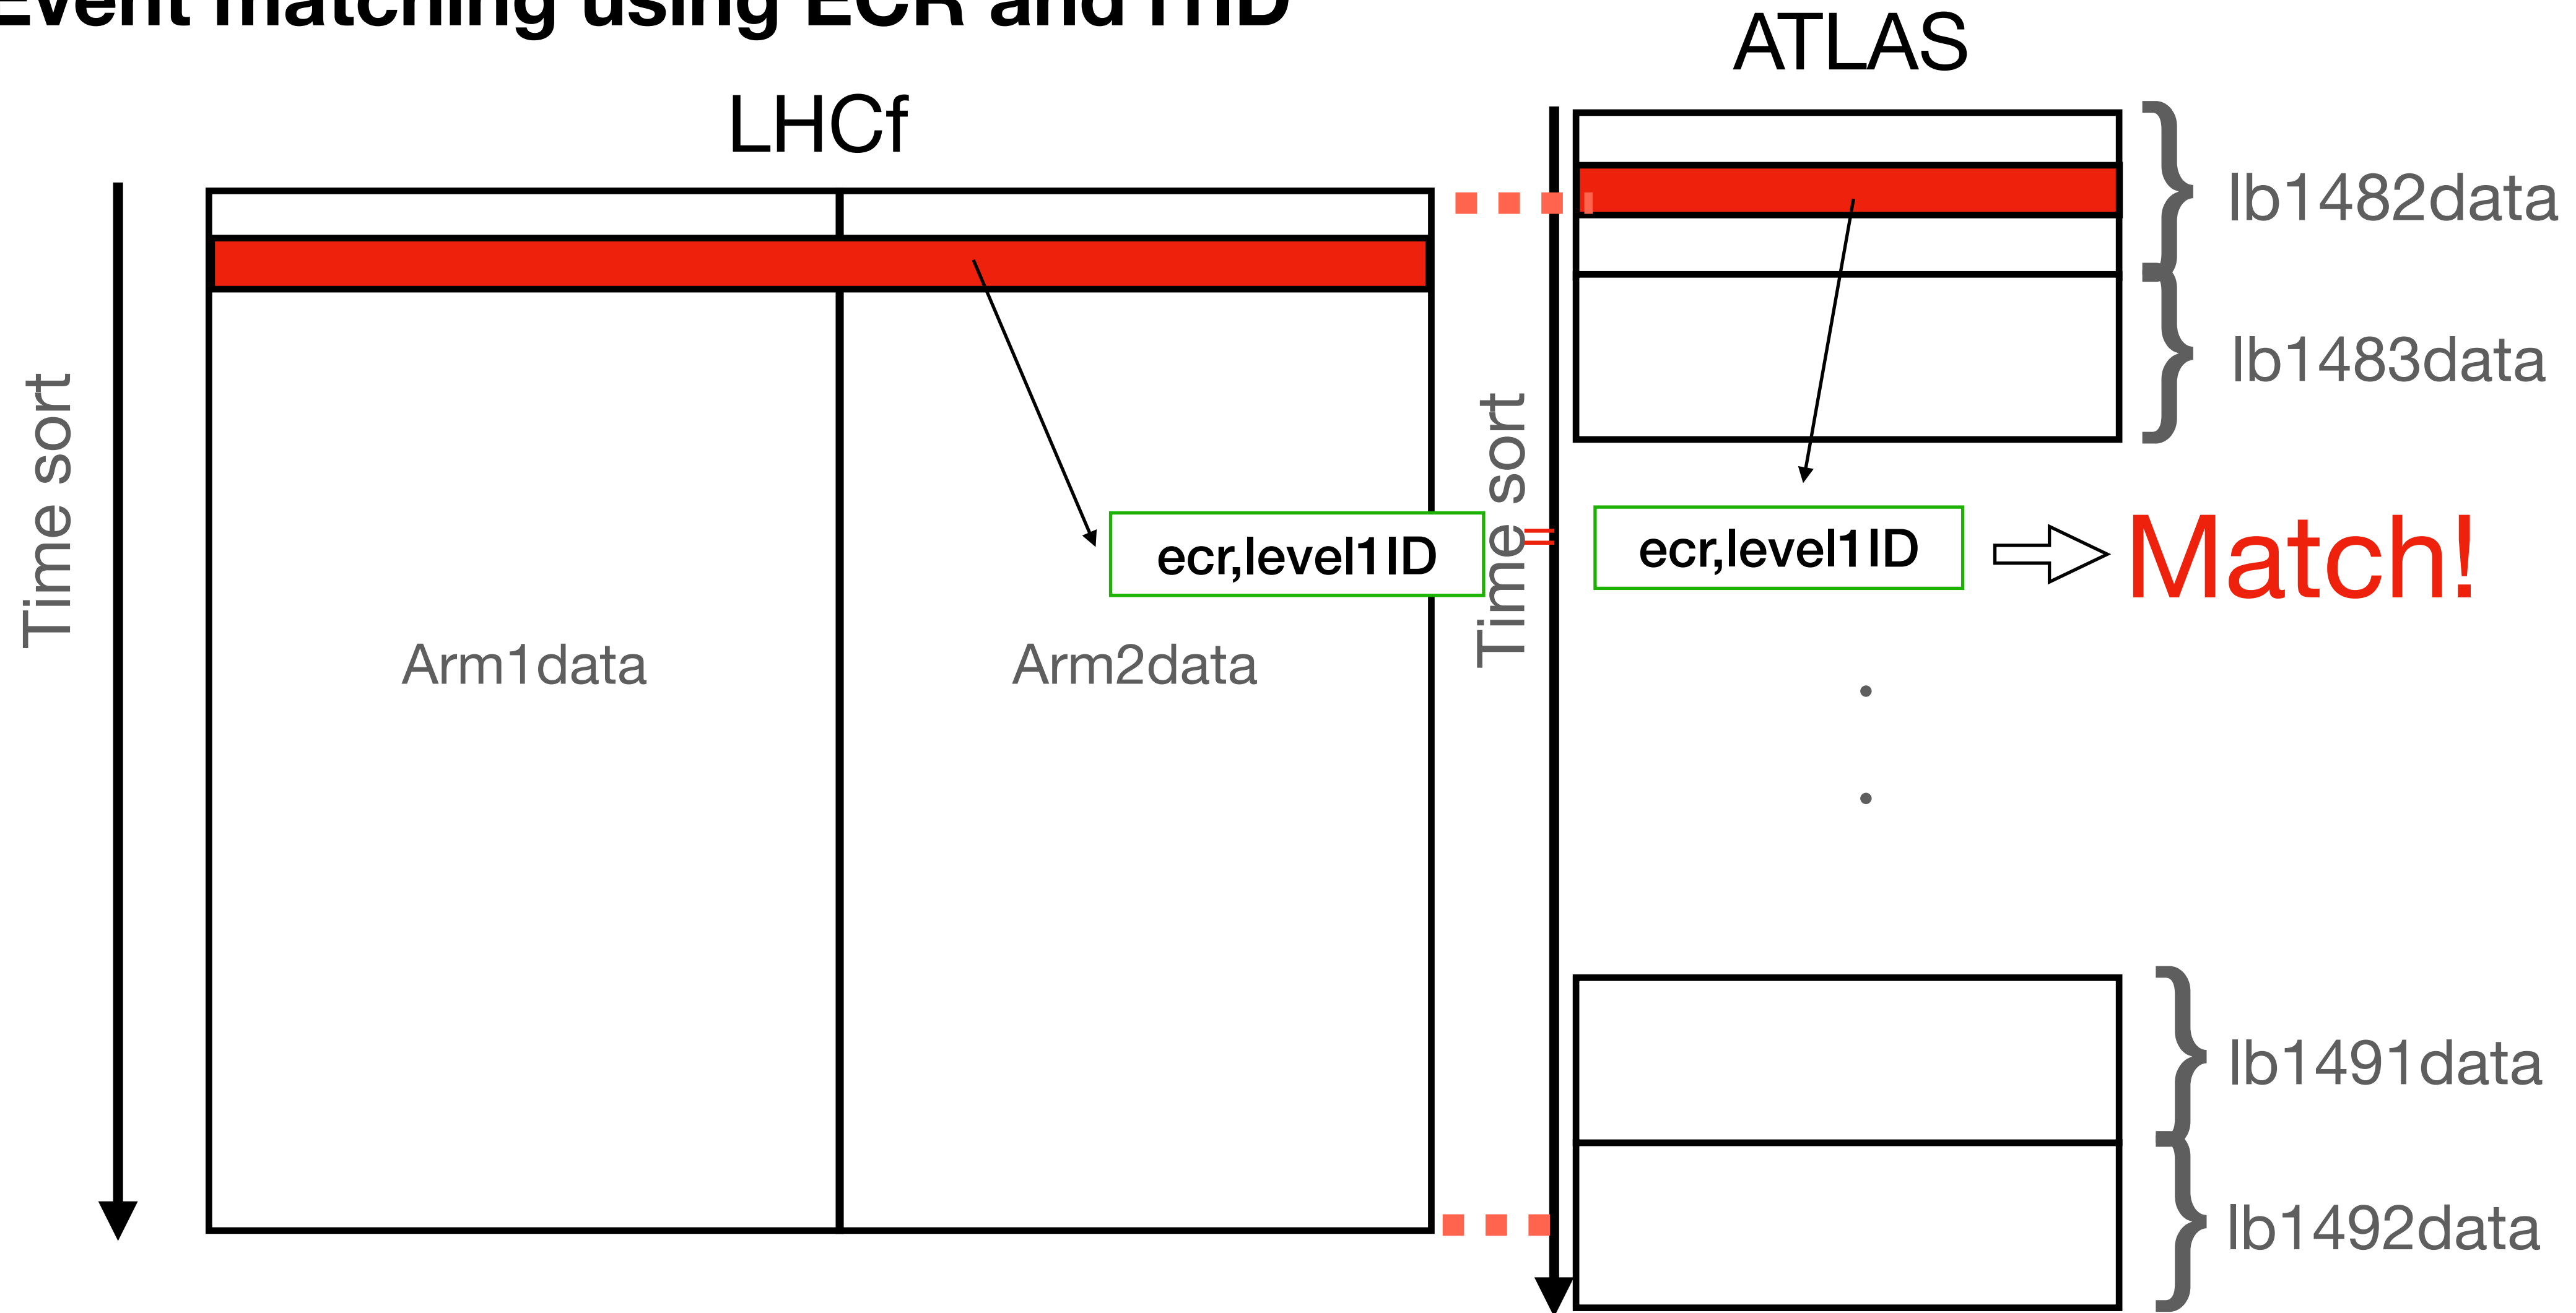

← (root file number) (entry number)

ex) get lb1482data

1. Record entry number written in lb1482\_014
2. Get data for entry number 1 from user.steinber.33458234.ANALYSIS.\_000014.root
3. Repeat for other root number 24,26,27,30,32

# Event matching

## Event matching using ECR and l1ID

# Data set

- data : Op2022  
LHCf : Run 80266~80364  
ATLAS : RunLBFiles\_1

```
[kinoshita.kosuke@lhcfx4 data_red]$ pwd  
/mnt/lhcfs5/data/menjo/Op2022/Arm2Rec_v0/data_red  
[kinoshita.kosuke@lhcfx4 data_red]$ ls -1U | wc -l  
85
```

```
[kinoshita.kosuke@lhcfx4 data_red]$ pwd  
/mnt/lhcfs5/data/menjo/Op2022/Arm1Rec_v0/data_red  
[kinoshita.kosuke@lhcfx4 data_red]$ ls -1U | wc -l  
367
```

Events with no data in ATLAS and data in LHCf : 10,439,204

→ Problem with the event reconstruction process.

Events with no data in LHCf and data in ATLAS : 0 ( a few )

→ Possible LHCf event missing at the time of Run switched

Check event match for LHCf-ATLAS bcid offset and Time offset.

# Confirmation

## ○ bcid scatter plot

offset : 174(all events)

vertical : ATLAS

horizontal : LHCf

left : Arm1

right : Arm2

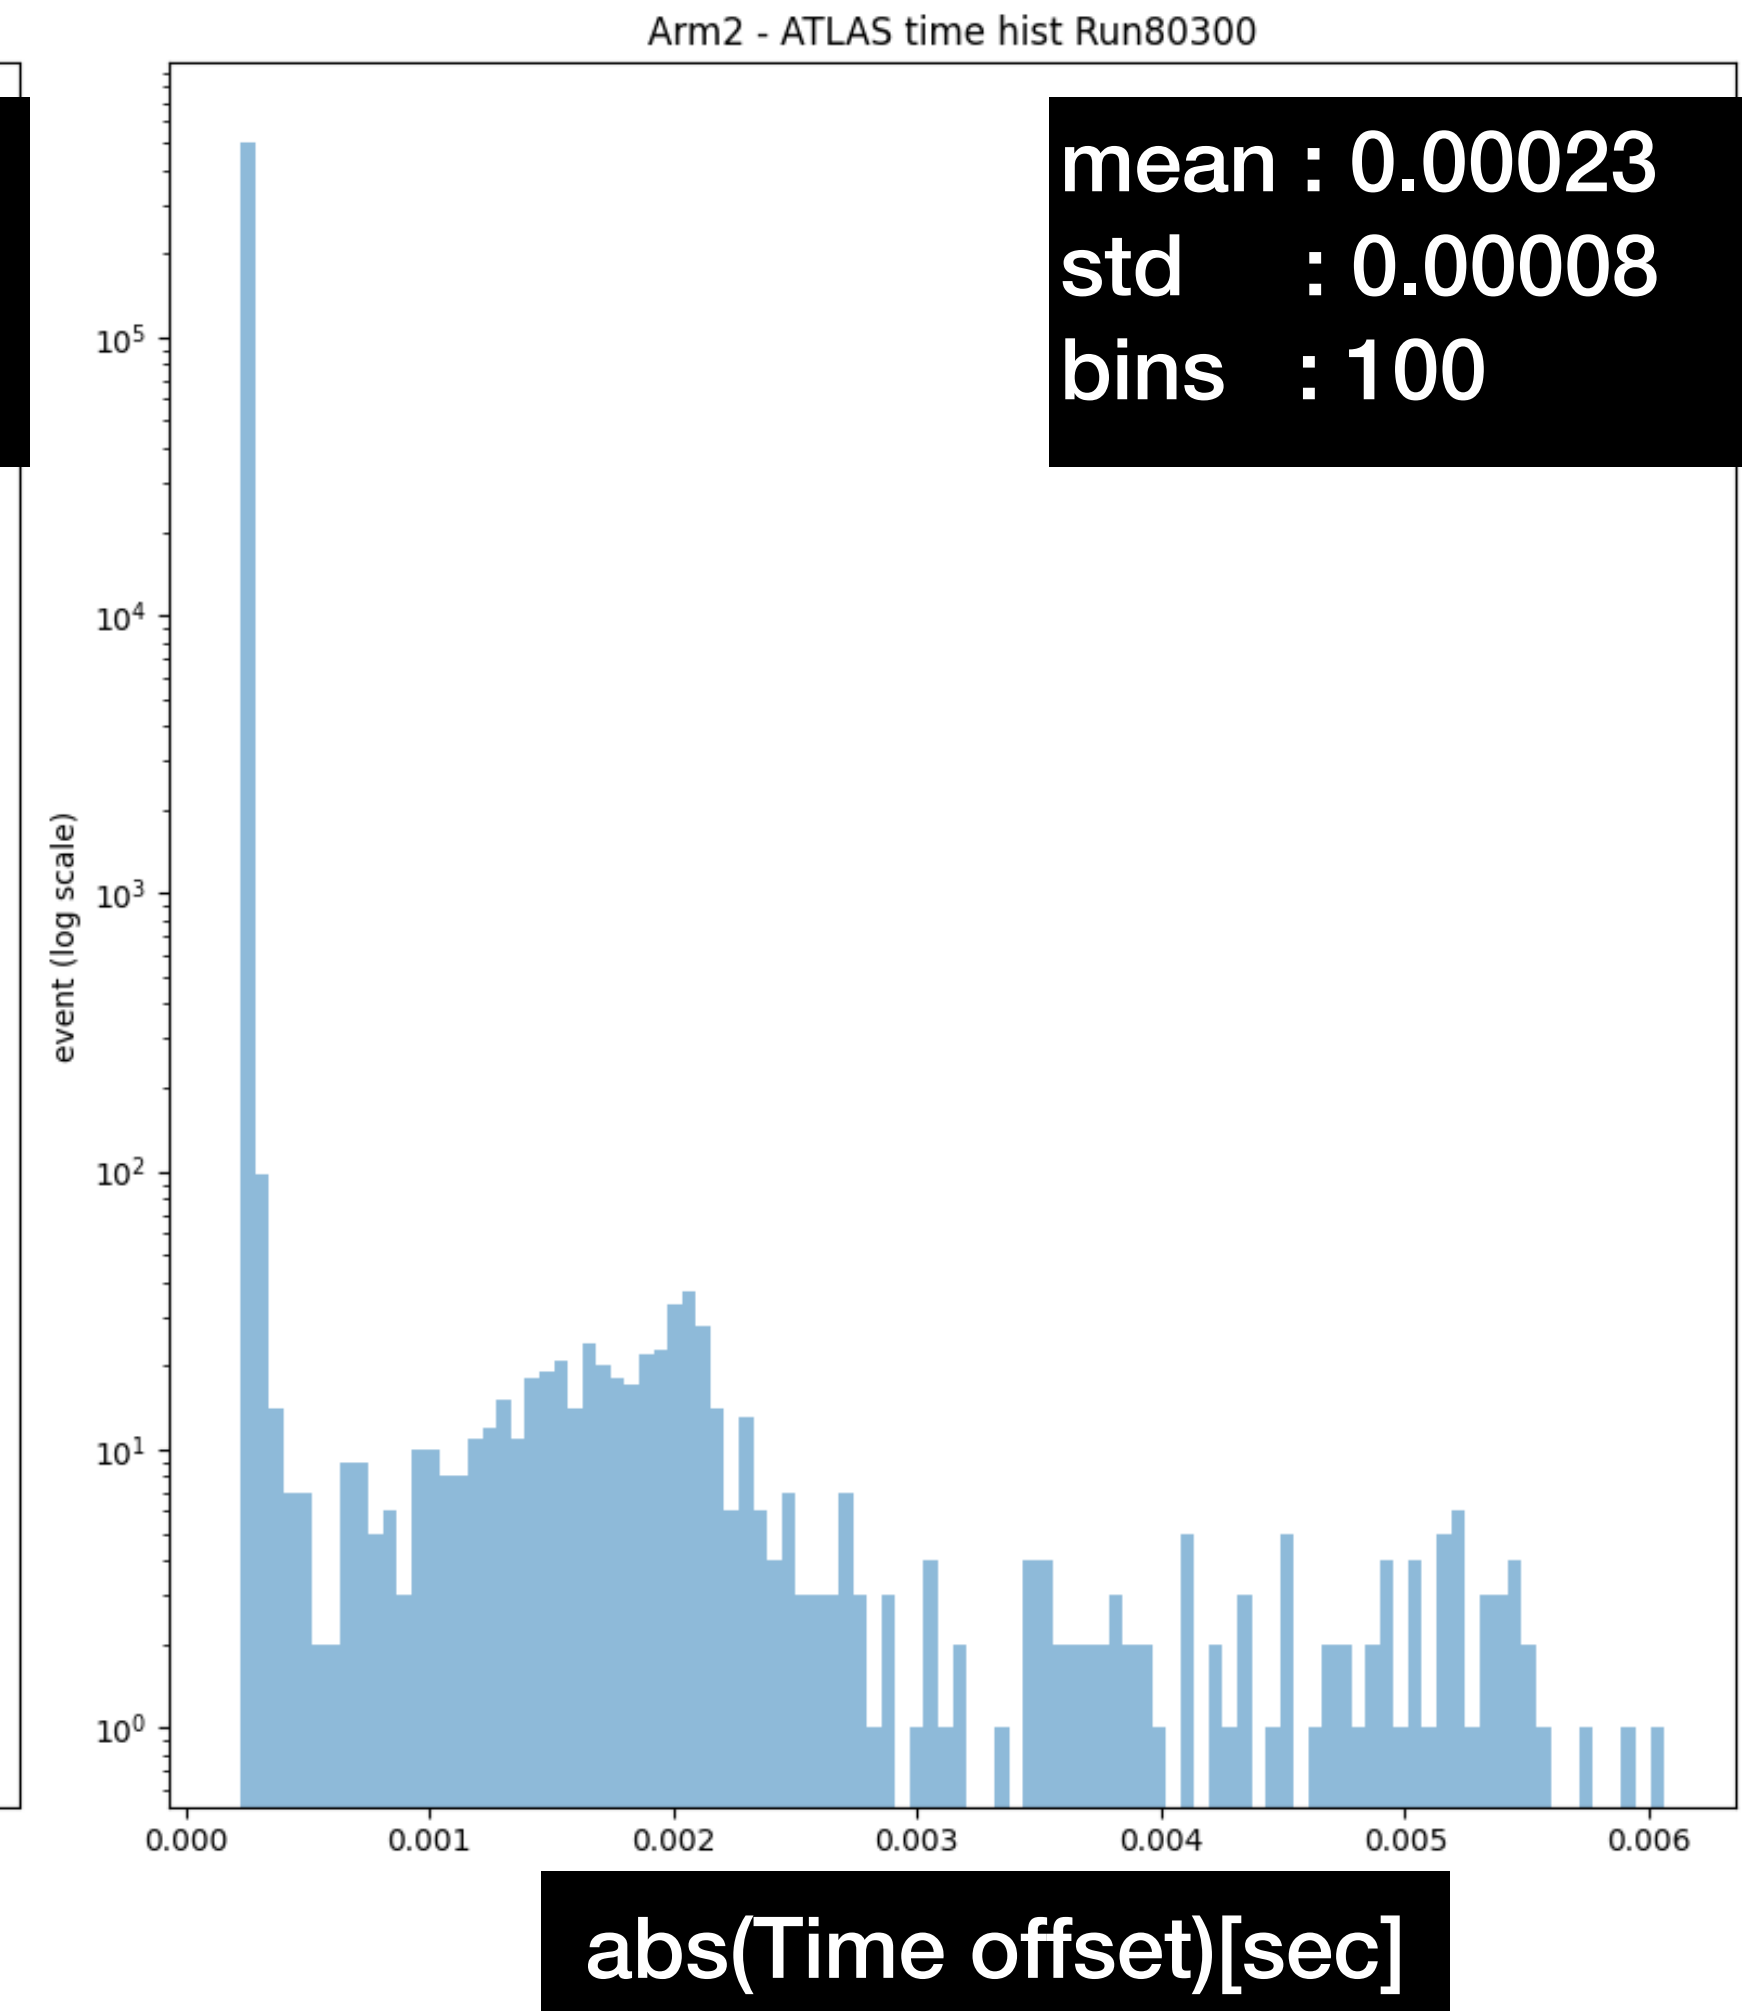

# Confirmation

## ○ time offset hist

vertical : event( log )  
horizontal : Time  
left : Arm1  
right : Arm2

# Conclusion

- **Summary of event matching.**

missing events( LHCf = 0events ,ATLAS = 10,439,204 events )

Bcid offset is constant.

The distribution of TimeStamps for Arm1 is 10 times wider than for Arm2.

- **Policy**

Check for bugs in the code.

Match and check with ver2 as soon as ver2 is ready.

Check to see if the events coincide in terms of physical phenomena

Perform physical analysis of events

**Back Up**

# Back Up

- The number of events in ATLAS varies greatly from one file version to another.
