

Horn studies for the CERN to Fréjus neutrino Super Beam

Nikolas Vassilopoulos on behalf of WP2,
IPHC, Strasbourg

Horn evolution

details in WP2 notes @
<http://www.euronu.org/>

evolution of the horn shape after many studies:

- triangle shape (van der Meer) with target inside the horn : in general best configuration for low energy beam
- triangle with target integrated to the inner conductor : very good physics results but high energy deposition and stresses on the conductors
- forward-closed shape with target integrated to the inner conductor : best physics results, best rejection of wrong sign mesons but high energy deposition and stresses
- forward-closed shape with no-integrated target: best compromise between physics and reliability
- 4-horn/target system to accommodate the MW power scale

Horn shape and SuperBeam geometrical Optimization I

Horn geometrical model

à la MiniBoone
("forward closed")

large acceptance for
forward produced particles

This shape is well suited
for long targets

Good suppression of wrong charge pion
dangerous in "-" focusing mode due to
 ν_e from $\pi^+ \rightarrow \mu^+ \rightarrow e^+ \nu_e \bar{\nu}_\mu$ and $K^+ \rightarrow \pi^0 e^+ \nu_e$

← EUROnu-WP2 note 05

A. Longhin

Third EUROnu annual meeting, RA

studies by A. Longhin, C. Bobeth

Optimization strategy

- Parametric model of magnetic horns
- Random sampling of parameters
- Ranking of configurations based on achievable θ_{13} limits

Figure of merit: $\lambda \equiv$
 θ_{13} sensitivity limit at 99% C.L. averaged over the δ_{CP} phase

$$\lambda = \frac{10^3}{2\pi} \int_0^{2\pi} \lambda_{99}(\delta_{CP}) d\delta_{CP}$$

We want as
low as
possible λ

- Broad sampling of the (many) parameters to identify the most relevant variables. Then restrict the ranges of variation and iterate.

→

A. Longhin

Third EUROnu annual meeting, RAL 19 Jan 2011

✓ parameterise the horn and the other beam elements
as decay tunnel dimensions, etc...

✓ parameters allowed to vary independently

✓ minimize the δ_{cp} -averaged 99%CL sensitivity limit on $\sin^2 2\theta_{13}$

Horn Shape and SuperBeam geometrical Optimization II

Broad scan

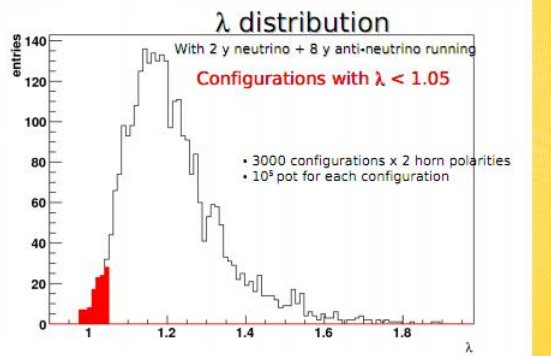

Allow parameters to vary independently

Limit	value
L_{max}	250 cm
R_{max}	80 cm
R_{min}	1.2 cm

Parameter	Interval
L_1	$[50, L_{max}]$ cm
L_2, L_3, L_4	$[1, L_{max}]$ cm
L_5	$[1, 15]$ cm
R, R_1, R_2	$[R_{min}, R_{max}]$
R_0	$[R_{min}, 4]$ cm
z_{tar}	$[-30, 0]$ cm
L_{tun}	$[35, 45]$ m
r_{tun}	$[1.8, 2.2]$ m

Parameter	Value
L_{tar}	0.78 m
r_{tar}	1.5 cm
i	300 kA
s	3 mm
r	5.08 cm

L_{max} and R_{max} : keep the horns small to allow for the 4-horns in parallel to fit

A. Lonohin

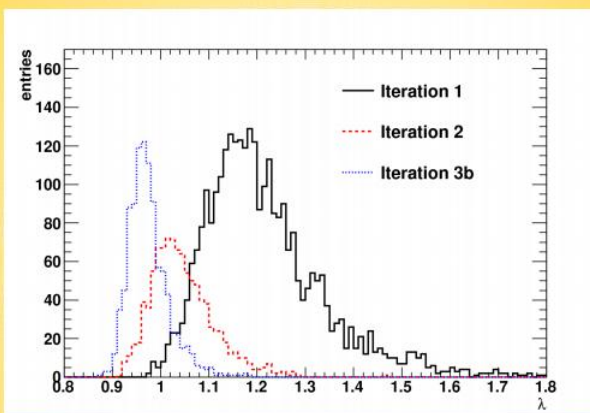

Third EUROnu annual meeting, RAL 19 Jan 2011

fix & restrict parameters then re-iterate for best horn parameters & SuperBeam geometry

Converging to better limits

- broad parameters' scan
- restricted intervals for effective parameters \rightarrow horn with min λ
- vary tunnel parameters in L [15-35] m r [1.5-4.5] m

A. Lonohin

Third EUROnu annual meeting, RAL 19 Jan 2011

Parameters	value [mm]
L_1, L_2, L_3, L_4, L_5	589, 468, 603, 475, 10.8
t_1, t_2, t_3, t_4	3, 3, 3, 3
r_1, r_2	108
r_3	50.8
R^{tg}	12
L^{tg}	780
z^{tg}	68
R_2, R_3	191, 359
R_1 combined	12
R_1 separate	30

Horn Stress Studies

➤ horn structure

- ✓ Al 6061 T6 alloy good trade off between mechanical strength, resistance to corrosion, electrical conductivity and cost
- ✓ horn thickness as small as possible: best physics, limit energy deposition from secondary particles but thick enough to sustain dynamic stress

➤ horn stress and deformation

- ✓ static mechanical model, thermal dilatation
- ✓ magnetic pressure pulse, dynamic displacement
- ✓ COMSOL, ANSYS software

➤ cooling

- ✓ water jets

Energy Deposition from secondary particles @1.3 MW

target $Ti=65\%d_{Ti}$, $R_{Ti}=1.5cm$

36kW, $t=30mm$

8.6kW,
 $t=35mm$

9.5kW

2.4kW

1.7kW

1.3kW

2.5kW

Energy deposition in kW/cm³

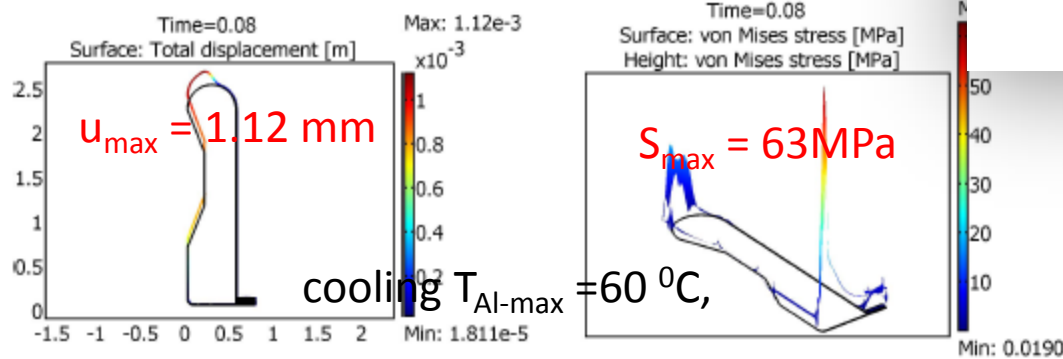

$$P_{tg} = 105kW$$

$$P_h = 62kW$$

Stress Analysis

➤ Thermo-mechanical stresses:

- ✓ secondary particles energy deposition and joule losses
- ✓ $T=60\text{ms}$, (worst scenario, 1 horn failed), $\tau_{01}=100\mu\text{s}$,
electrical model: $I_0 = 350\text{kA}$, $f=5\text{kHz}$, $I_{\text{rms}}=10.1\text{kA}$,

a) $u_{\text{max}} = 1.12 \text{ mm}$

b) $s_{\text{max}} = 62 \text{ MPa}$

c) $u_{\text{max}} = 2.4 \text{ mm}$

d) $s_{\text{max}} = 6 \text{ MPa}$

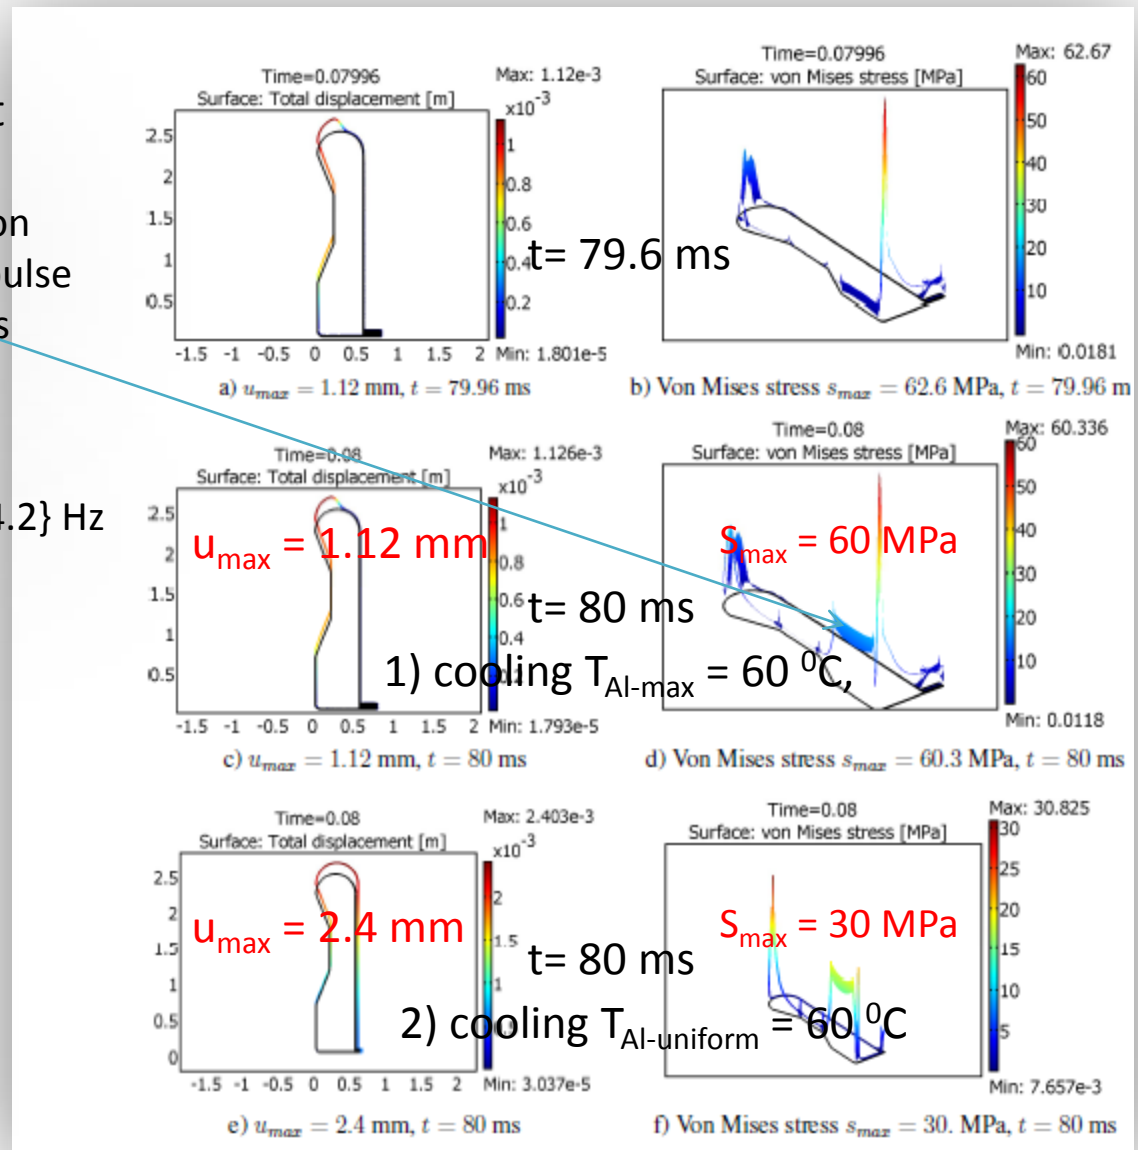

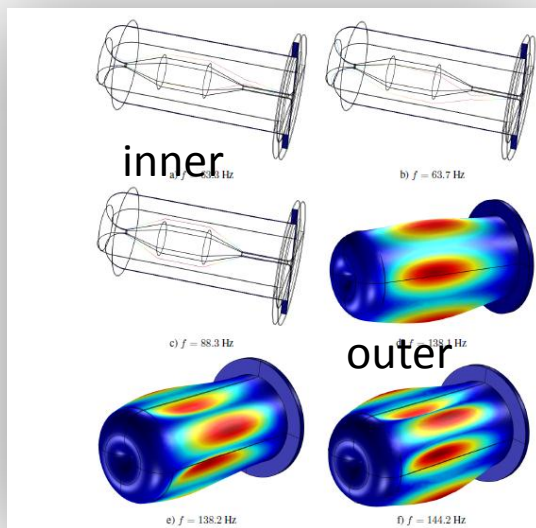

stress minimized when horn has uniform temperature

F. Osswald, V. Zeter/IPHC,
P. Cupial, M. Koziem, L. Lacny,
B. Skoczen *et al.* /Cracow Univ. of Tech.

Stress due to thermal dilatation and magnetic pressure

- displacements and stress plots just before and on the peak
 - ✓ stress on the **corner** and **convex** region
 - ✓ stress on **the upstream inner** due to pulse
 - ✓ uniform temperature minimizes stress
- modal analysis, eigenfrequencies
 - ✓ $f = \{63.3, 63.7, 88.3, 138.1, 138.2, 144.2\}$ Hz

peak magnetic field each $T=80$ ms (4-horns operation)

Horn cooling

power distribution on Al conductor
secondary particles (66%) + joule (34 %)

Projet EUROnu
La Corne

L'ensemble de la Corne

IPHC Strasbourg 02/05/2011

Valeria Zeter

cooling system

- planar and/or elliptical water jets
- 30 jets/horn, 5 systems of 6-jets longitudinally distributed every 60°
- flow rate between 60-120l/min, h cooling coefficient 1-7 kW/(m²K)
- longitudinal repartition of the jets follows the energy density deposition
- $\{h_{\text{corner}}, h_{\text{horn}}, h_{\text{inner}}, h_{\text{convex}}\} = \{3.8, 1, 6.5, 0.1\}$ kW/(m²K) for $T_{\text{Al-max}} = 60$ °C

horn lifetime

6 – 60 MPa expected

Horn response under pulse magnetic forces

SINGLE PULSE with static thermal stress SVM=102.5 MPa and maximal magnetic stress SMAX=41 MPa – estimated life time

S-N curve - probability	Life time [s]		
	Rayleigh	Dirlik	Benasciutti-Tovo
95%	2.7076e+007	8.6147e+007	7.9627e+007
50%	6.0195e+006	1.8589e+007	1.7026e+007
5%	2.1816e+006	6.5918e+006	6.0132e+006

NUMBER OF PULSES
Dirlik model
f = 12.5 Hz

highly conservative

S-N CURVE PROBABILITY	LIFE TIME [s]	NUMBER OF PULSES
95 %	$8.6 \cdot 10^7$	$1.08 \cdot 10^9$
50 %	$1.9 \cdot 10^7$	$2.38 \cdot 10^8$
5 %	$6.6 \cdot 10^6$	$8.25 \cdot 10^7$

1.25 10⁸ pulses = 200 days = 1 year

Power Supply

Power Supply for horn pulsing (another challenge)

P. Poussot, J. Wurtz/IPHC

conclusions

- Al 6061 T6 alloy for radiation, reliability and cost
- convex shape defined for optimum physics
- low stress on inner conductor when uniform cooling is applied < 30 MPa
- horn lifetime > 10^8 cycles (1 year)
highly conservative
- power supply & cooling R&D needed

4-horn system for power accommodation

Parameters	value [mm]
L_1, L_2, L_3, L_4, L_5	589, 468, 603, 475, 10.8
t_1, t_2, t_3, t_4	3, 10, 3, 10
r_1, r_2	108
r_3	50.8
R^{tg}	12
L^{tg}	780
z^{tg}	68
R_2, R_3, R_4	191, 359, 272
R_1 non integrated	30

Table 1: Horn geometric parameters.

Parameters	Range	Reference value
Beam Power P_{beam} [MW]	-	4
Energy per pulse [kJ]	-	80
Kinetic energy of protons [GeV]	-	4.5
Number of pulse in 1s	-	50
Number of protons per pulse	-	1.11×10^{14}
Number of bunch per pulse	-	6
Number of protons per bunch	-	1.85×10^{13}
bunch duration [ns]	-	120
Energy per bunch [kJ]	-	13.33
Power for each bunch [GW]	-	111
repetition rate per horn [Hz]	-	12.5 (16.6)
Power per horn [MW]	1 ... 1.3	1.4
Peak Current I_0 [kA]	300 ... 350	350
Beam width σ [mm]	-	4
Current frequency per horn [Hz]	-	12.5 (16.6)

Table 2: Beam and horn parameters.
