Ring of 27 Km
4 Interaction points (IP)

Wire compensation at the 2
main **Interaction Points:**
IP1 ATLAS
IP5 CMS

Nominal Luminosity :
 $10^{34} \text{ cm}^{-2} \text{ s}^{-1}$

Nominal Energy :
7 TeV

Compensate long range beam beam with a wire

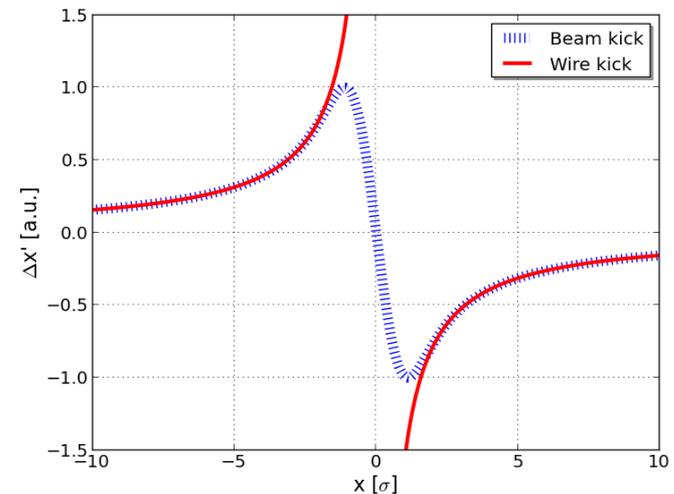

Motivation:

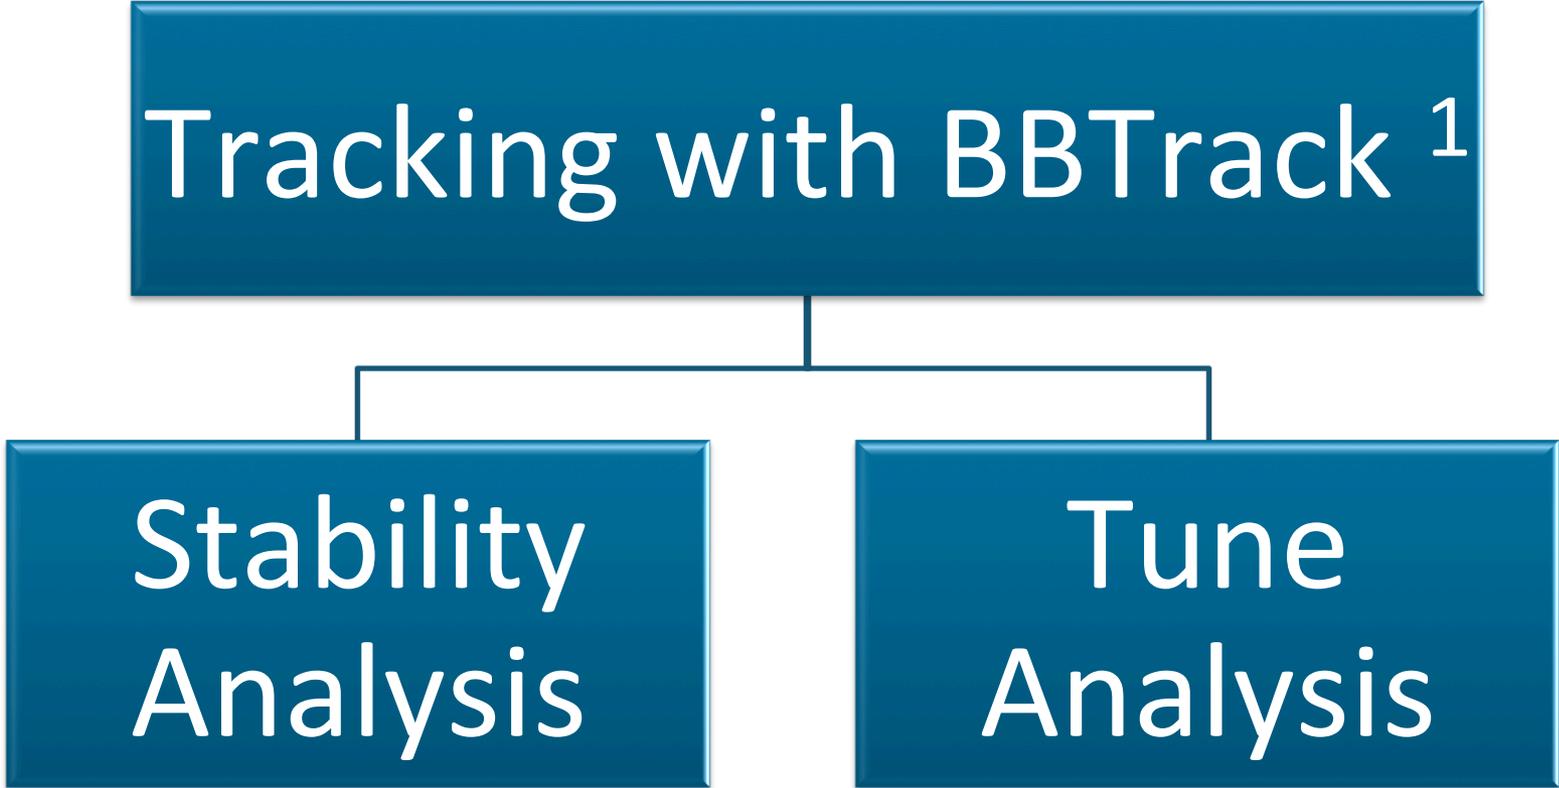

Head On: at IP beams collision
Long Range: electromagnetic beam beam interaction out the IP

In our analysis

HOLR -> Head On at IP1 and IP5
 16 Long Range before IP
 16 Long Range after IP

Tracking with BBTrack ¹

- More than 4000 particles with max radius $[0,9] \sigma$
- Tracked for at least 300.000 turns
- Particles set unstable when $\lambda[j] > 2.8$
- Color emphasizes the turn where particle become unstable

$\lambda[j] = \text{Lyapunov coefficient at turn } j$

[Formulas](#)
[Optics par](#)

Lyapunov coefficient: rates of divergence of nearby trajectories in phase space

definition

$$\lambda = \lim_{N \rightarrow \infty} \lim_{d(0) \rightarrow 0} \frac{1}{N} \log \frac{d(N)}{d(0)}$$

$d(N)$ = distance between trajectories at turn N

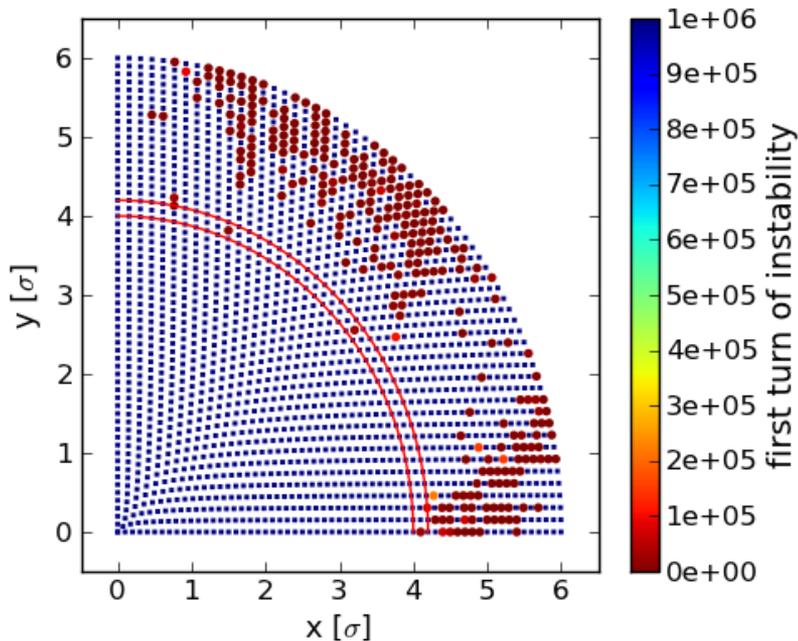

Used in the code

$$\lambda[j] = \frac{\langle d_r[\frac{j}{2} : j] \rangle - \langle d_r[0 : \frac{j}{2}] \rangle}{\langle d_r[\frac{j}{4} : \frac{3j}{4}] \rangle} \geq 2.8$$

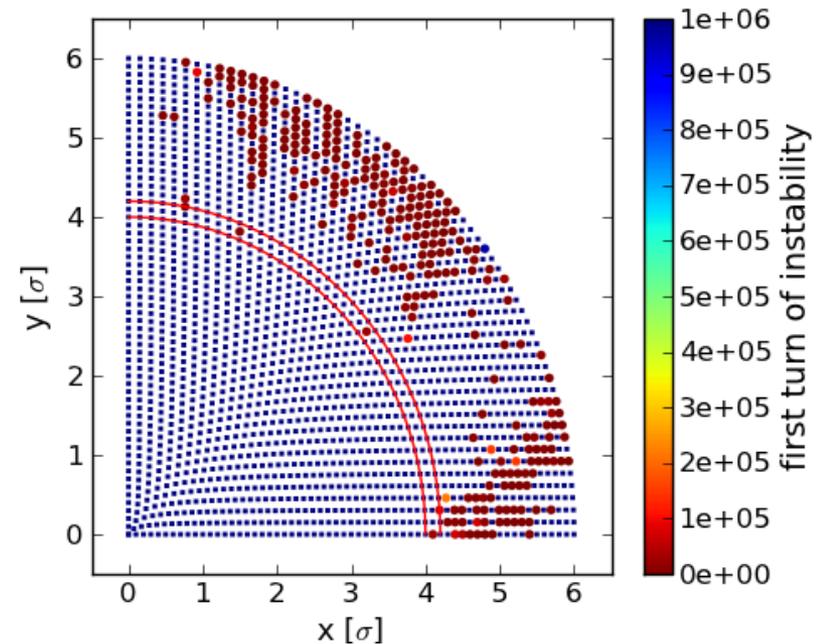

d_r = normalized distance in 4 dim

Criterion stable increasing the number of turns!

600.000 turns

1.000.000 turns

Head On + Long Range – crossing angle 6.3σ

[Stability](#)
[Tune](#)

[Longitudinal B](#)
[Longitudinal P](#)
[Transv & Curr](#)

[Best res.](#)
[First prop.](#)
[Cross. Angle](#)
[Wire Shape](#)

[Conclusions](#)

[Next Steps](#)
[Adds](#)
[Formulas](#)
[Optics par](#)

- Tracked between 1.000 and 10.000 particles (depend on the test performed)
- Calculated the tune
- Verified if the fractional part of the tune touches resonance lines

Studied Cases

Requirements

Requirements for a good compensation

$$\beta_x = \beta_y \quad \text{at each IP} \quad \text{or} \quad \beta_y (IP1) = \beta_x (IP5)$$

$$\beta_x (IP1) = \beta_y (IP5)$$

$\beta_{x,y}$ (1) Big enough

$\Delta\mu_{x,y}$ (2) Small enough

-
1. $\beta_{x,y}$ = Betatron function
 2. $\Delta\mu_{x,y}$ = phase advance between the average LRBB and the wire position

- ✓ We studied a possible compensation of long range beam beam effects in LHC with a DC wire compensator
- ✓ We analyzed the tune and stability for different configurations
 - ✓ Wire Longitudinal positions
 - ✓ Wire Transverse position
 - ✓ Wire Current
 - ✓ LHC optics
- ✓ From tune analysis
 - ✓ best transverse location 9.5σ with current 177 A
- ✓ From stability analysis
 - ✓ best transverse location 11σ with current 237 A
- ✓ Longitudinally, best compensation at BBC location
- ✓ Promising results also at TCT opt β or TCT with modified optics

- ✓ Varying the crossing angle we see that wire compensator allows to reduce crossing angle of $1-2 \sigma$ maintaining the same stable region
- ✓ Wire shape (square vs pencil like) doesn't affect our results

Thank you!

$$\Delta Q_x = -\frac{\mu_0 L_w I_w}{2\pi B_d \rho} \frac{\beta_x}{4\pi} \left(-\frac{2d x_w^2}{(d x_w^2 + d y_w^2)^2} + \frac{1}{d x_w^2 + d y_w^2} \right)$$

$$\Delta Q_y = -\frac{\mu_0 L_w I_w}{2\pi B_d \rho} \frac{\beta_y}{4\pi} \left(-\frac{2d y_w^2}{(d x_w^2 + d y_w^2)^2} + \frac{1}{d x_w^2 + d y_w^2} \right)$$

$$d^2 = x_w^2 + y_w^2$$

μ_0 = free permeability

L_w = wire length

I_w = wire current

$B_d \rho$ = magnetic rigidity

$\beta_{x,y}$ = betatron function

(x_w, y_w) = wire coordinates

Round beam – horizontal cross

Long range kick

$$\Delta x' = -\frac{2Nr_0}{\gamma} \frac{x-d}{r^2} \left(1 - \exp\left(\frac{r^2}{2\sigma^2}\right) \right)$$

$$\Delta y' = -\frac{2Nr_0}{\gamma} \frac{y}{r^2} \left(1 - \exp\left(\frac{r^2}{2\sigma^2}\right) \right)$$

$$r^2 = (x-d)^2 + y^2$$

Wire kick

$$\Delta x' = -\frac{2Nr_0}{\gamma} \frac{x-x_w}{r_w^2}$$

$$\Delta y' = -\frac{2Nr_0}{\gamma} \frac{y-y_w}{r_w^2}$$

$$r_w^2 = x^2 + y^2$$

N = nbr protons
 r_0 = classical radius
 d = distance between beams centers
 σ = standard deviation
