# ELENA Project Review 

## Power Converters John Baillie TE/EPC/MPC

15 ${ }^{\text {th }}$ October 2013

## Overview of Power Converters for ELENA

Around 400kVA Installed Power All power derived from 400V Network

Ring: 26 Magnetic Circuits
Electron Cooler: 11 Circuits
Transfer Lines: 12 Magnetic Circuits 184 Electrostatic Circuits

## Total: 233 Circuits

19 Racks
10 Racks Ring and Magnetic Transfer line Converters
3 Racks Electron Cooler
1 Rack Control
3 Racks Spare Main Dipole Converter
2 Rack Various Spares

400V Supply Transformers (EN/EL)

## Cycling Magnetic Circuits

- Magnetic Elements in the ring will follow a varying current or field reference.
- Uncertainty of 500ppm, referred to instantaneous requested current/field, must be respected at all energy levels
- All circuits require relatively small voltages at lowest energy level

Expected duration up to 30s
Maximum ramp time of 1 s has been assumed for dimensioning of ring power converters

| Skew Quadrupole PXMXNADNAP | 2 | 1 | 100 | 0.013 | 33 | 4.500 | 3.7 | CANCUN_50 100ppm | 30 | 50 | 5 | $1.11 \times 10^{-4}$ |
| Comp. Solenoid PXMLNAFNAC | 2 | 1 | TBD | TBD | TBD | TBD | TBD | CANCUN_50 <br> 100ppm | 30 | 50 | 5 | TBD |

Notes: Total circuit impedances include cables which have been estimated based on conductor material, length and cross section $<2 \mathrm{~A} / \mathrm{mm}^{2}$. Minimum current assumes $0.137 \times$ max flat-top current.

## TE

Technology Department

## Cycling Magnetic Circuits: V/I Waveforms

Main Dipoles

Main Quadrupoles

Sextupole

Skew Quadrupole

- Compensation Solenoid Awaiting magnet parameters
- All converters are 4 quadrant. Can provide negative voltage if necessary and have no problem operating near 0 V which is a strong requirement for these circuits.
- Degaussing waveforms is possible for all magnets

## IE

Technology Department

## Dynamic Performance using Function Generator Controller

Looking at the transition between first and second plateaux for the main dipole:

## IE

## Technology

Department

Bending and Quadrupole elements are powered using two back-to-back unipolar power supplies, polarity reversal is only possible with the addition of a polarity switch

Electrodes are always powered with a positive and negative power supply: Neither electrode is at ground potential

Technology
Department

H/V Correctors powered using two back-to-back biploar power supplies; polarity reversal is inherently possible.

## TE

## Technology

Department

- 197 elements and 184 circuits; some elements will be powered in parallel from the same power converter.
- Differential Voltage range of 250 V to 70 kV . Achievable using commercial HV Cassette type power supplies.
- Controlled using a PLC

Justification for using B193_R-407:

- 2 pairs of $400 \mathrm{~mm}^{2}$ cables available.
- Main Dipole (326A)
- TL Dipole (285A)
- EN/EL have final say
- False floor would need to be constructed in B195
- Close to 400V distribution transformers

19 Racks
10 Racks Ring and Magnetic Transfer line Converters
3 Racks Electron Cooler
1 Rack Control
3 Racks Spare Main Dipole Converter
2 Rack Various Spares

## AD Upper Floor Electrical Requirements: DC Side

## 184 Electrostatic Circuits!

Circuit voltages and polarity reversal options to be finalized
EPC will specify cables and connectors and request a job for the placement by EN/EL.

Septum converter rated 1200A. Magnet designed for 1150A.

- Latest operational requirement is 950A.
- Assuming copper cables of $800 \mathrm{~mm}^{\wedge} 2$ ( $2 x 400 \mathrm{~mm}^{\wedge} 2$ ):
- 8.7 V is required in steady state
- 9.1 V is required for 1 second ramp
- $3 \times 15 \mathrm{~V} 400 \mathrm{~A}$ converters connected in parallel is proposed
- Current sharing is active
- Voltage drop of cables is very significant as resistance of the septum is only $8 \mathrm{~m} \Omega$.

Technology
Department $\quad$ Cooling and Ventilation

Only the ring dipole power converter is water cooled.
The expected power to the cooling circuit is $<10 \mathrm{~kW}$.
<10degC temperature rise inlet to outlet
Total max pressure drop of circuit $=3.5 \mathrm{bar}$
In B193_R-407 total losses to air of the order of 40kW -> will be able to provide a more accurate figure. This is also strongly a function of the cycle definition.

## List of Power Converters

| Designation | Manufacturer |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Technology Conclusions

- Still to define:
- Compensation Solenoid Power Converter (Working on base of CANCUN_50)
- Still to confirm:
- Polarity Reversal Requirements of Electrostatic Elements
- Electron Cooler requirements
- Documentation to upload to EDMS
- Work Package Descriptions
- Data for EN/EL: AC, DC and control cabling requirements
- Circuits must be finalised by the end of November to ensure that EPC can respect foreseen install date of June 2015.

## BACKUP - TL Dipole Magnet Characteristics

| Parameter | Value | Unit | Remark |
| :---: | :---: | :---: | :---: |
| Type | Racetra ck |  |  |
| Cooling | Watercooled |  |  |
| Conductor material | Copper |  |  |
| Conductor dimensions | $10 \times 10$ | $\begin{gathered} \mathrm{mm} x \\ \mathrm{~mm} \end{gathered}$ | Luvata Nr. 8139 |
| Hole diameter of conductor | 5.7 | mm |  |
| Cross section of conductor | 73.6 | $\mathrm{mm}^{2}$ |  |
| Insulation | 0.5 | mm |  |
| Coil windings | $\begin{gathered} 8 \times 8= \\ 64 \end{gathered}$ |  |  |
| Coil cross-section | $94 \times 94$ | $\begin{gathered} \mathrm{mm} \mathrm{x} \\ \mathrm{~mm} \end{gathered}$ | Includes 3 mm ground insulation |
| Bending radius | 20 | mm | $=3.5 \mathrm{x}$ hole diameter |
| Resistance at $20^{\circ} \mathrm{C}$ | 47 | $m \Omega$ | For two coils in series per magnet |
| Inductance | 32 | mH | Per magnet |
| Coil mass | 70 | kg | Estimate |

| Parameter | Value | Unit | Remark |
| :---: | :---: | :---: | :---: |
| Magnet | MBL |  |  |
| Current | 285 | A |  |
| Current density | 3.9 | $\mathrm{~A} / \mathrm{mm}^{2}$ |  |
| Voltage | 13.4 | V | At steady operation |
| Maximum voltage during | 18 | V |  |

## Table from DS 07/08/2013

| Element type | Label | Short label | Total number of magnets | Resistance in mOhm | i mH | field |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PXMBHEKCW |  |  |  |  |  |
| Bending Magnet, Horizontal | P | MBR | 8 | 8 47 | 34 | 326 |
| Quadrupole, Normal | PXMQNLGNAP | MQR | 13 | 3103 | 36 | 37 |
| Sextupole, Normal | PXMXNADNAP |  | 5 | 560 | 6 | 21 |
| Quadrupole, Skew | PXMQSABNAP | MQS | 3 | 333 | 10 | 33 |
|  | PXMCCAYWA |  |  |  |  |  |
| Corrector $\mathrm{H}+\mathrm{V}^{*}$ | P | MCR | 9 | 932 | 4 | 45 |
| Solenoid | PXMLNAFNAC | MLR | 3 | 3 TBD | TBD | TBD |
|  | PXMBHCBCW |  |  |  |  |  |
| TL Bending magnet | P | MBL | 3 | 347 | 32 | 285 |

Technology Department

| 2.1 Measurement Characteristics |  |
| :---: | :---: |
| Nominal Output Voltage | 10 V |
| Nominal current | 600A |
| Output polarity | Bipolar (no discontinuity at zero) |
| Stability | <2 ppm over 30 minutes |
| Unipolar linearity | < 10 ppm (for both polarities) |
| Gain | $\begin{aligned} & +10 \mathrm{~V} \text { at }+600 \mathrm{~A} \\ & -10 \mathrm{~V} \text { at }-600 \mathrm{~A} \end{aligned}$ |
| Gain: adjustment and resolution | Adjustable to 0 ppm error, Resolution 0.2 ppm , <br> Range $\pm 200 \mathrm{ppm}$ |
| Gain: initial error | < 50 ppm |
| Gain: drift | < $5 \mathrm{ppm} / 24 \mathrm{~h},<10 \mathrm{ppm} /$ month, $<30 \mathrm{ppm} /$ year |
| Gain: temperature coefficient | <2 ppm/K |
| Positive-Negative gain error | < 5ppm |
| Output offset: adjustment and resolution | Adjustable to 0 ppm error, Resolution 0.2 ppm Range $\pm 100 \mathrm{ppm}$ |
| Output offset: initial error | < 5 ppm |
| Output offset: drift | <3ppm/24h, $<5 \mathrm{ppm} /$ month, $<10 \mathrm{ppm} /$ year |
| Output offset: temperature coefficient | < 1 ppm/K |
| CMRR | $>80 \mathrm{~dB}$ @ DC to 100 Hz |
| Bandwidth of output signal | 15 kHz |
| Rms value of output noise related to $V_{\text {out }}$ | $\begin{aligned} 10 \mathrm{~Hz} \ldots 100 \mathrm{~Hz} & <2 \mathrm{ppm}^{\mathrm{pp}} \\ 100 \mathrm{~Hz} \ldots 10 \mathrm{kHz} & <10 \mathrm{ppm}^{\mathrm{pp}} \\ >10 \mathrm{kHz} & <30 \mathrm{ppm}^{\mathrm{pp}} \end{aligned}$ |
