Is there Life after Higgs?

Beyond SM?

How do we achieve our goal?

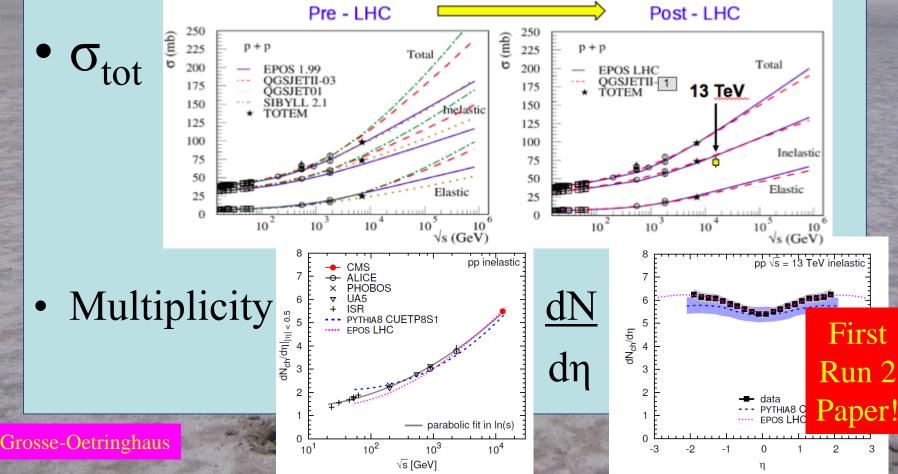

Tests of SM Top physics - Mass, A_{FB} , ...? Producing new particles - e.g., Higgs Possible signals - e.g., boosted jets Backgrounds - e.g., pile-up

The basis for everything at the LHC

Soft QCD at the LHC

 Needed to model backgrounds for precise measurements, discoveries – also cosmic rays

Hard QCD at the LHC

de Visscher

• PDF uncertainties greatly reduced thanks to LHC

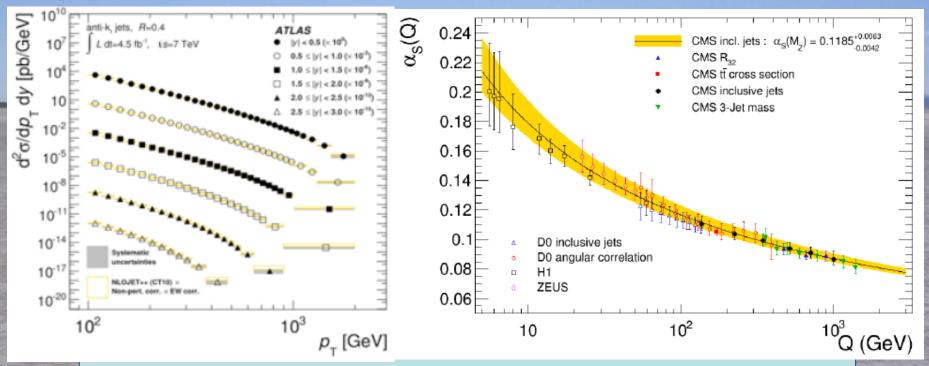

- State-of-the-art calculations NNLO, NLO EW
- N3LO Higgs σ

Zanderighi

- NNLO kinematic distributions
- New era in precision H physics

QCD Tests at the LHC

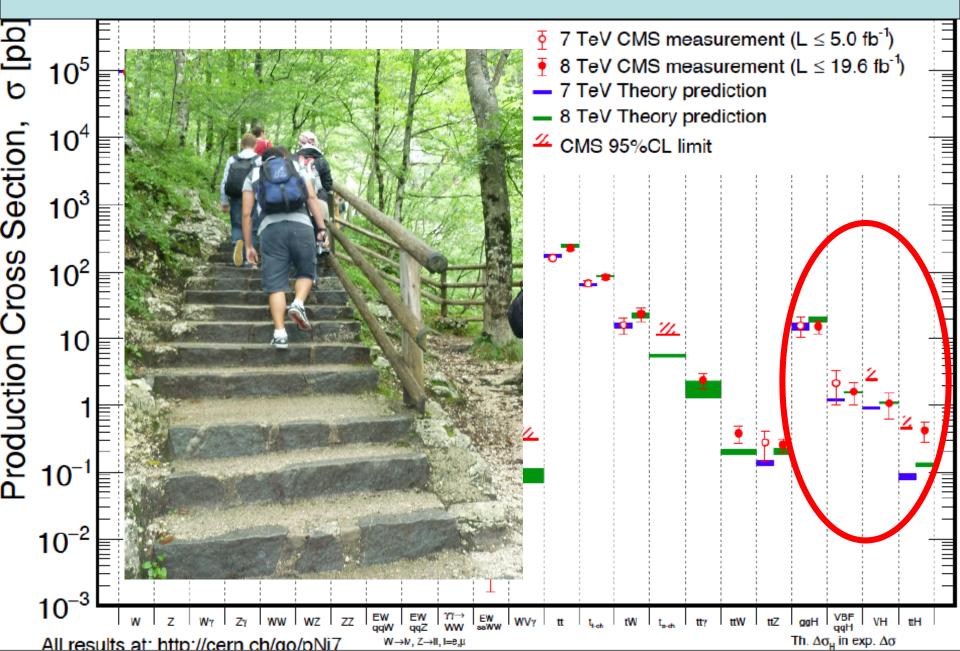

- QCD predictions successful over many orders of magnitude
- **α_s runs beyond the TeV scale**: into a GUT?

De Visscher

• Consistent with world average

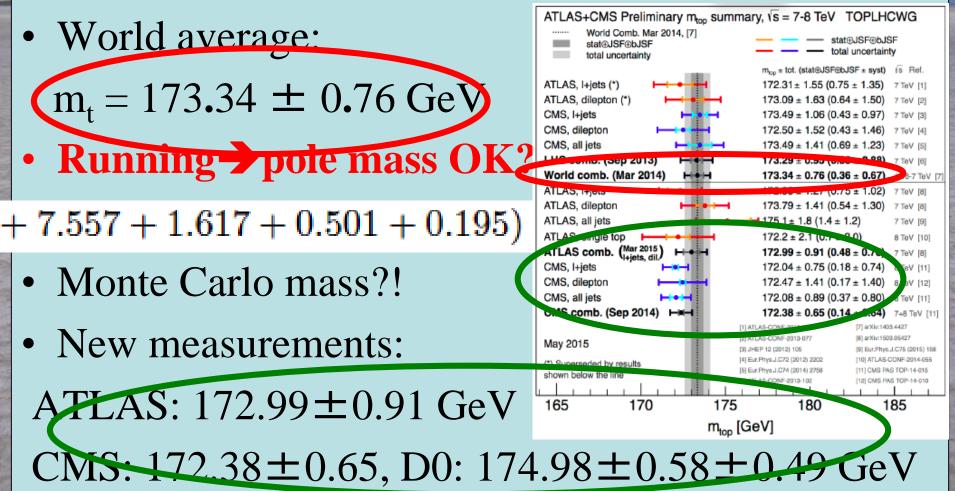

Standard Model Cross-Sections @ LHC

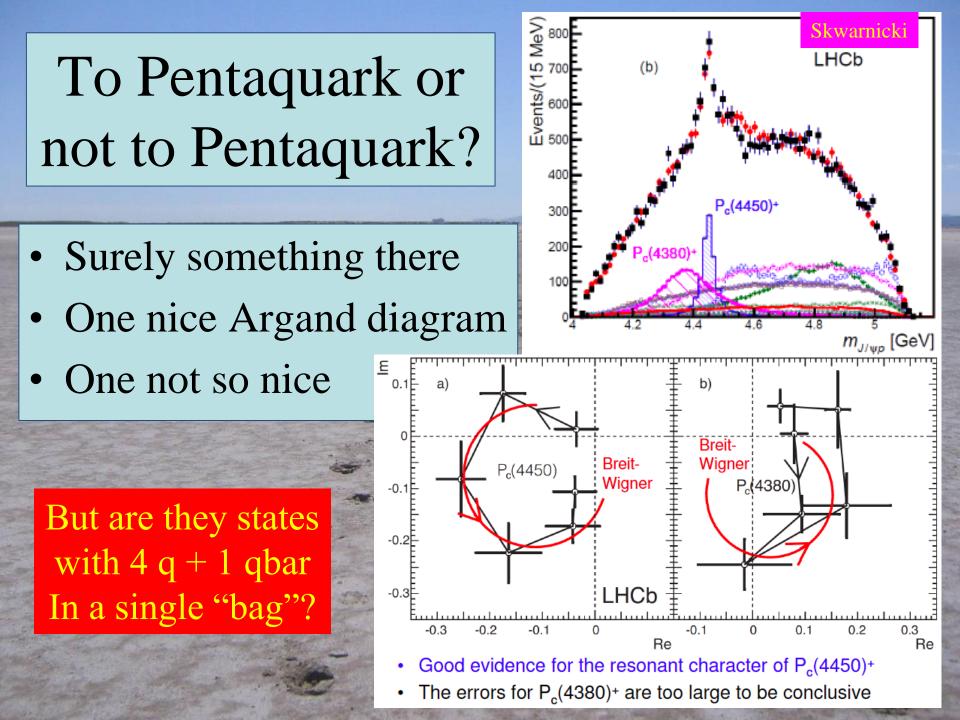

Melnikov, Meyer

Hard QCD: the Top Mass

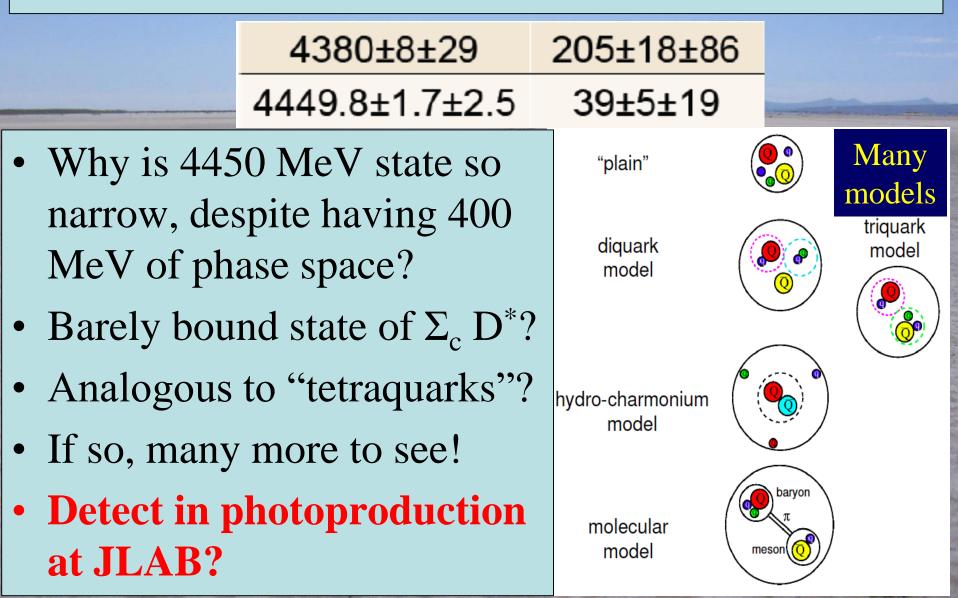

• Basic parameter of SM; stability of EW vacuum?

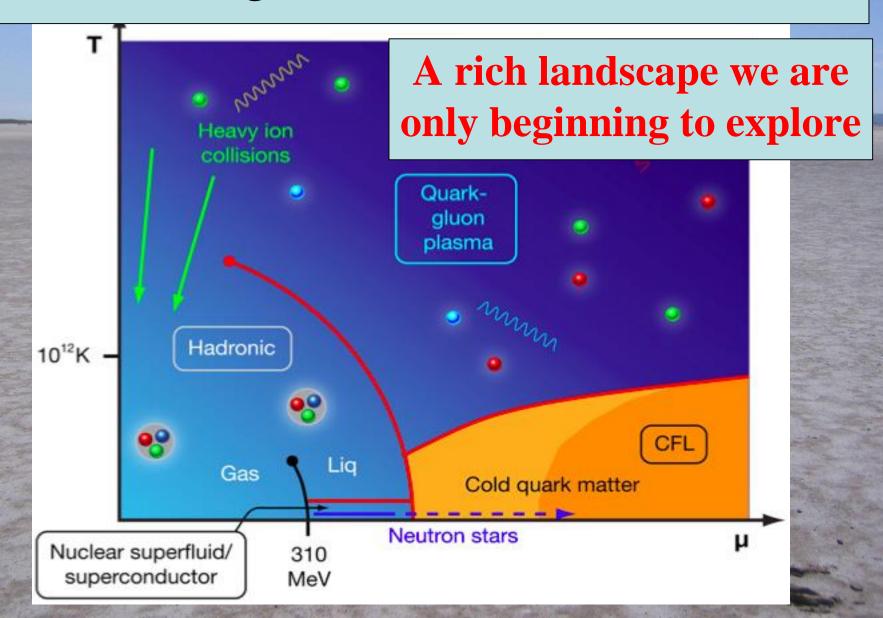

Skwarnicki, Bondar

To Pentaquark or not to Pentaquark?

Vuorinen, Arnaldi

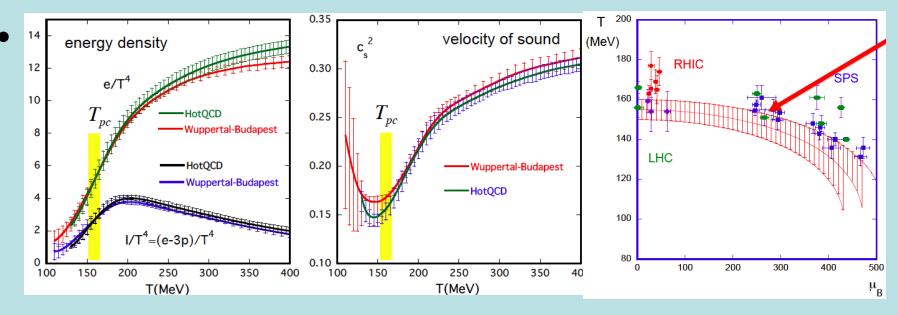

Phase Diagram of Nuclear Matter

Lattice at Finite T, μ_B

• **QCD phase transition**: crossover T = 155±5 MeV

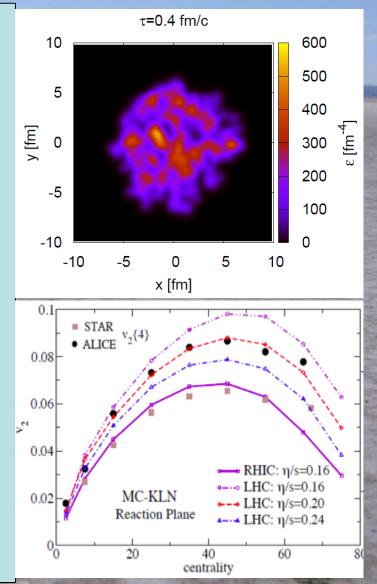

• Extrapolation to $\mu_B \neq 0$: T < chemical freeze-out? (Charge fluctuations yield T \approx hadron abundances)

No relights solar lation of oritical and n

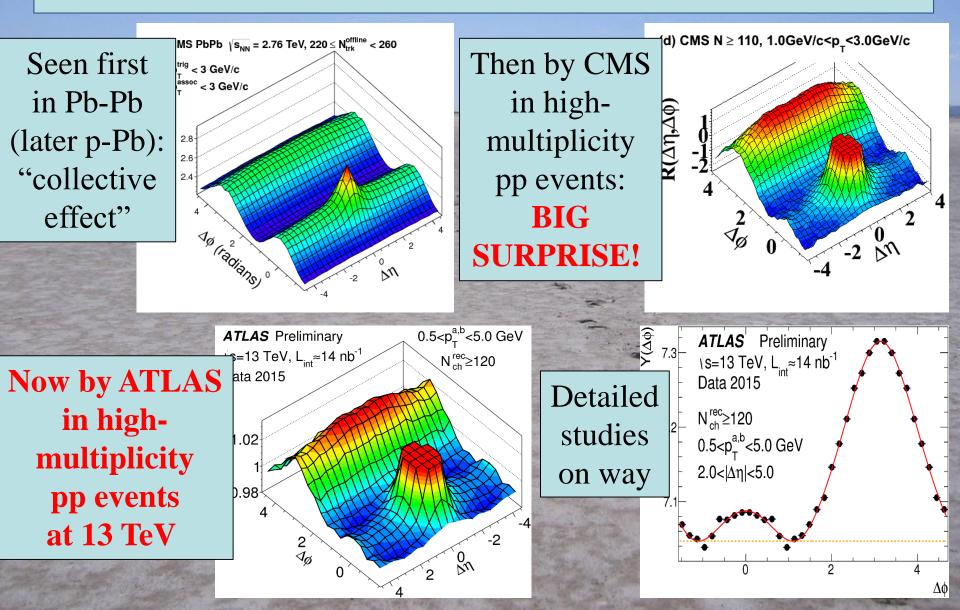

Anisotropies in Little Bangs

- Many anisotropies $v_n \neq 0$
- Collective hydrodynamic flow
- Constraints on viscosity η - $\eta/s < 0.2$: lowest known?
- Value close to lower limit from stringy AdS/CFT $\eta/s = 1/4\pi$
- Increase from RHIC to LHC?
- Interpolation towards perturbative QCD?

Vuormen

"Ridge": Collective Effect in pp?!

How do we achieve our goal?

Beyond SM?

Standard Model EFT

Higgs: CP, κ_{y,f}, flavour violation, ...

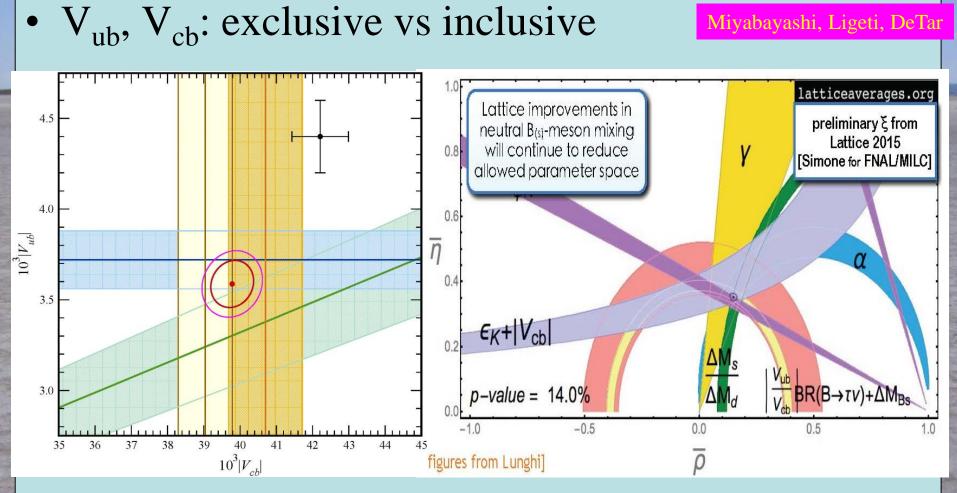

Electroweak: sin²θ, TGCs, ...

Flavour: Top, CKM, anomalies, ...

QCD: soft, heavy ions, PDFs, hard, ...

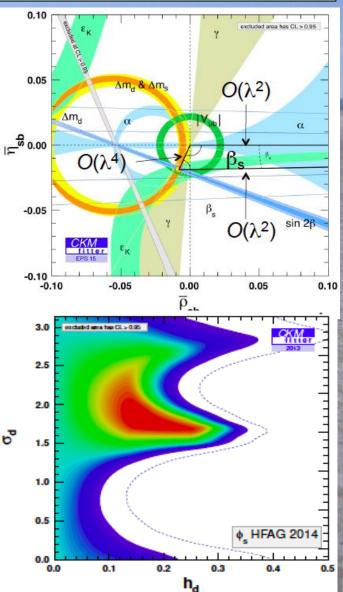

Unitarity Triangle 2015

Lattice input crucial for exclusive V_{ub}, B_s mixing

Flavour Physics

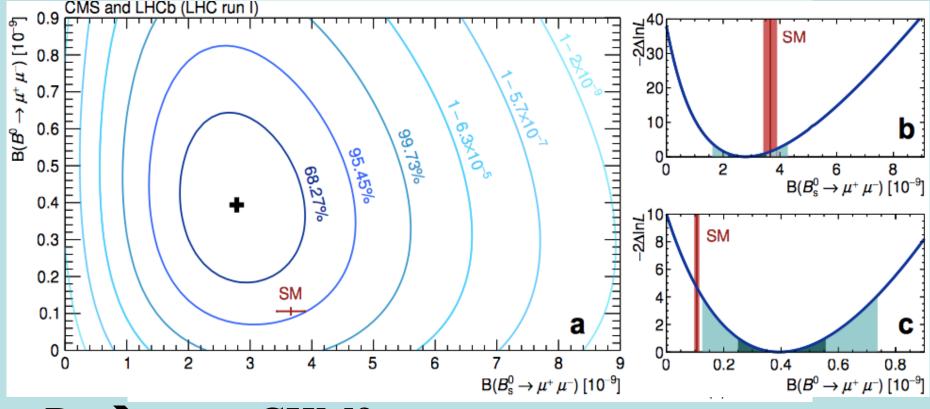

- CKM picture works very well
- Second unitarity triangle?
- Many successful predictions:
 - Many modes of CPV
 - No sign of CPV in charm ⊗
- Could still be substantial BSM contributions to B physics
- Does TeV physics copy CKM?
 Minimal flavour violation?

Mivabavashi

$B_{s,d} \rightarrow \mu^+ \mu^- Decays$

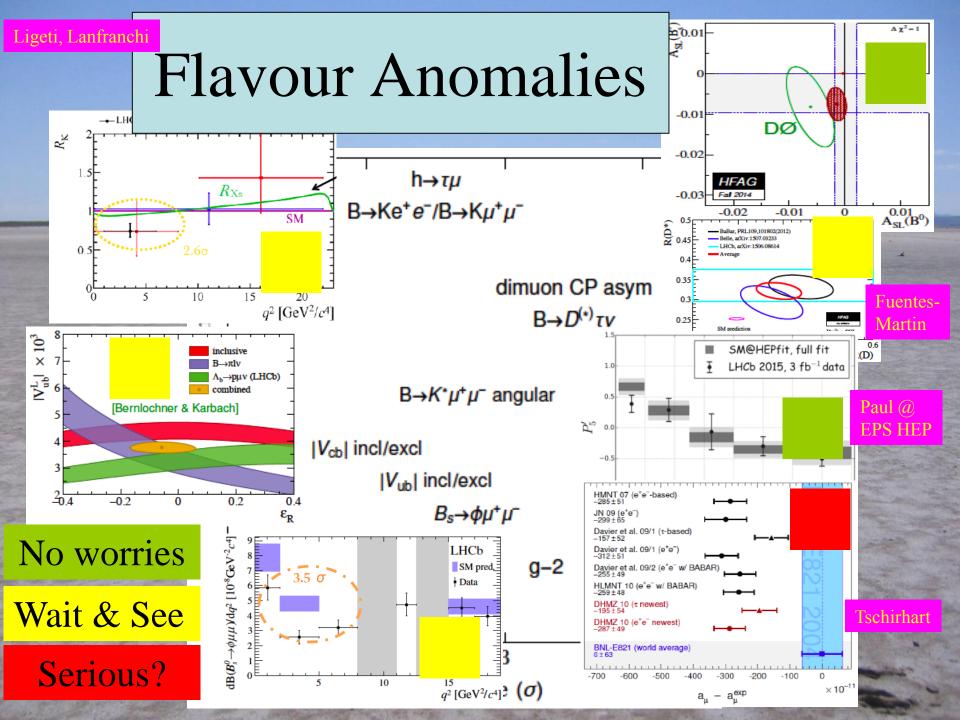

• $B_s \rightarrow \mu^+ \mu^-$ success for CKM

• $B_d \rightarrow \mu^+ \mu^- > CKM?$

Lanfranch

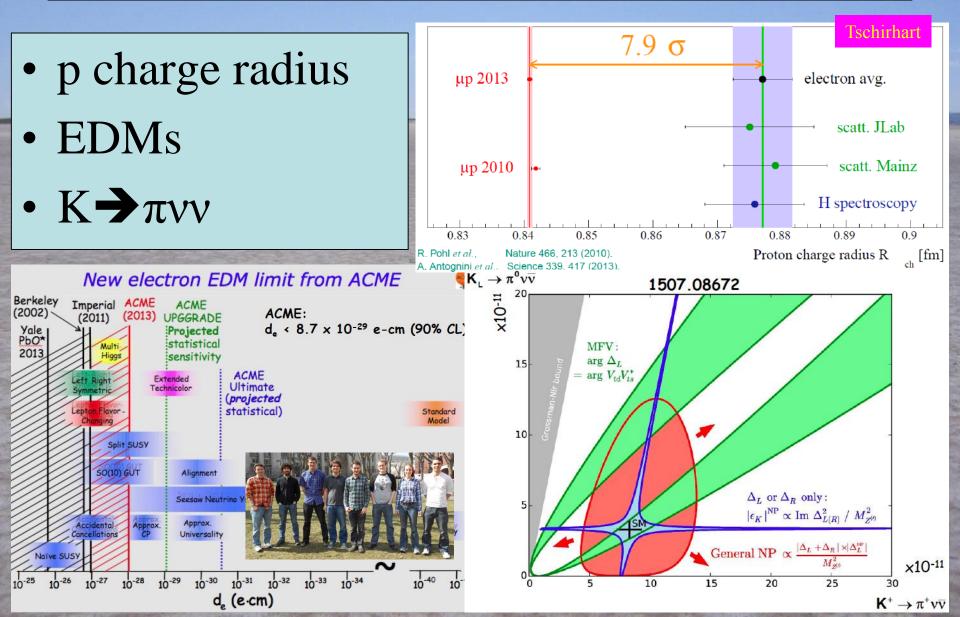

- Would require non-minimal flavour violation

Miller

Other Low-Energy Physics

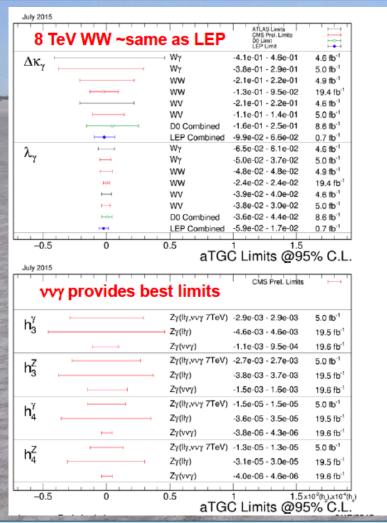

EW Physics at Tevatron & LHC

Einsweiler

- Forward-backward asymmetry in Z production at Tevatron gives precision in sin²θ in same ball-park as LEP or SLC
- Could do better by combining CDF, D0 using e⁺e⁻ and μ⁺μ⁻

Einsweiler

Important ingredients in global fits to SM EFT

Higgs Mass Measurements

Farringtor

• ATLAS + CMS ZZ^* and $\gamma\gamma$ final states

• Statistical uncertainties dominate

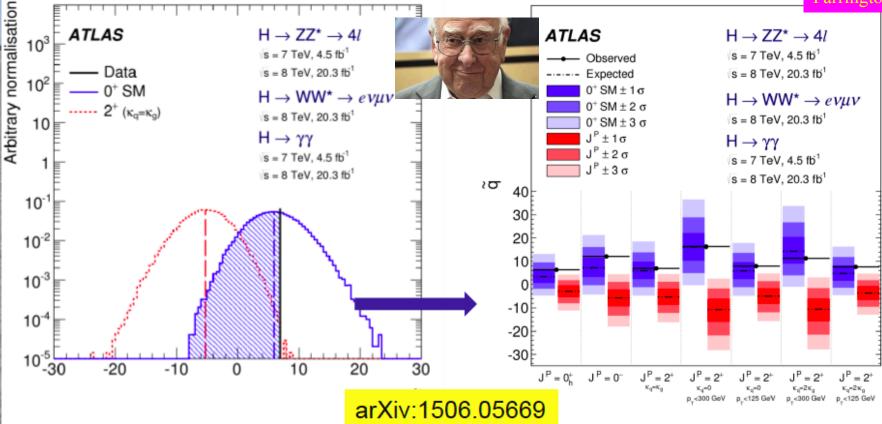

• Allows precision tests

Crucial for stability of electroweak vacuum

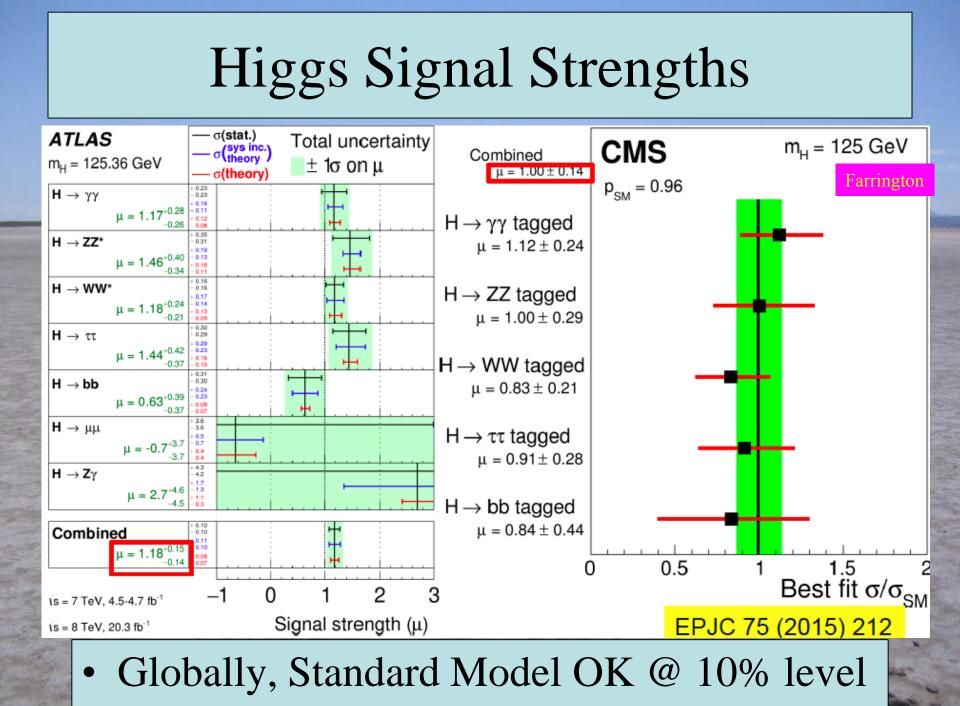

It Walks and Quacks like a Higgs • Do couplings scale ~ mass? With scale = v? 19.7 fb⁻¹ (8 TeV) + 5.1 fb⁻¹ (7 TeV) CMS $\lambda_f = \sqrt{2} \left(\frac{m_f}{M}\right)^{1+\epsilon}, \ g_V = 2 \left(\frac{m_V^{2(1+\epsilon)}}{M^{1+2\epsilon}}\right)^{1+\epsilon}$ 68% CL ັວ 10⁻¹ 95% CL SM Higgs 10⁻² Global (M, ε) fit 10⁻³ fit - 68% CL 95% CL 10^{-4} 10 100 01 Particle mass (GeV) • Solid line = SM, dashed line = best fit

H Spin-Parity Tests: 0⁺ AOK

Farrington

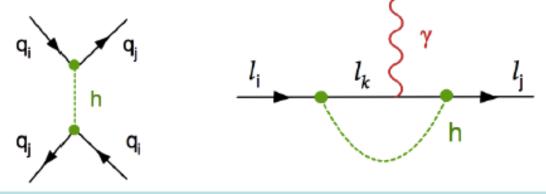

• Alternative spin-parities disfavoured > 99.9%

Flavour-Changing Couplings?

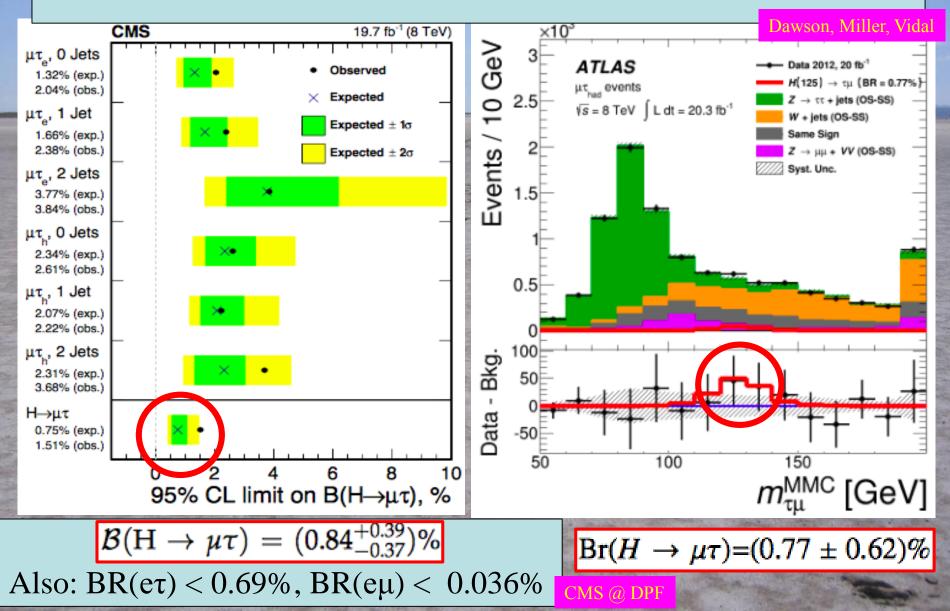

• Upper limits from FCNC, EDMs, ...

- Quark FCNC bounds exclude observability of quark-flavour-violating h decays
- Lepton-flavour-violating *h* decays could be large:
 Either BR(τμ) or BR(τe) could be O(10)%

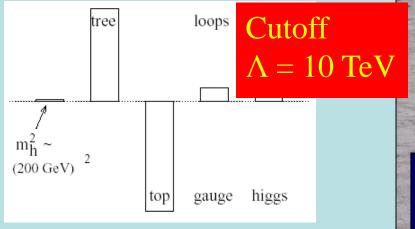

Blankenburg, JE, Isidori: arXiv:1202.5704 Harnik, Kopp, Zupan: arXiv:1209.1397 B BR(μe) must be < 2 × 10⁻⁵

Flavour-Changing Higgs Couplings?

Elementary Higgs or Composite?

- Higgs field: $<0|H|0> \neq 0$
 - Quantum loop problems

Cut-off Λ ~ 1 TeV with Supersymmetry?

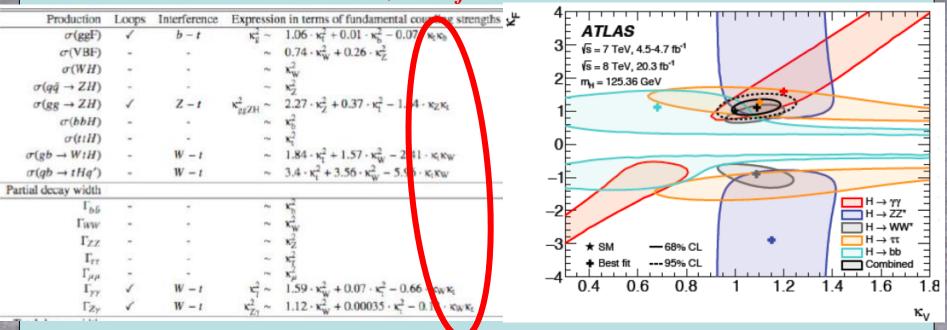

• Fermion-antifermion condensate

McCullough

- Just like QCD, BCS superconductivity
- Top-antitop condensate? needed m_t > 200 GeV
- New technicolour force?
 Heavy scalar resonance?
 Inconsistent with precision electroweak data?
 Little Higgs, ...

Global Analysis of Higgs-like Models

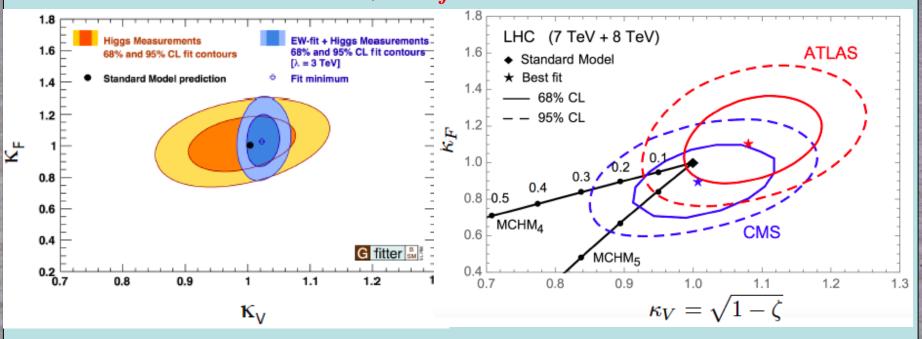

- Farrington
- Rescale couplings: to bosons by κ_V , to fermions by κ_f
- Standard Model: $\kappa_V = \kappa_f = 1$

• Sensitive to relative sign: interference in gg, $\gamma\gamma$, tH, $Z\gamma$

Global Analysis of Higgs-like Models

- Rescale couplings: to bosons by κ_V , to fermions by κ_f
- Standard Model: $\kappa_V = \kappa_f = 1$

- Consistency between Higgs and EW measurements
- Must tune composite models to look like SM

Why is there Nothing rather than Something?

- Higher-dimensional operators as relics of higherenergy physics: $\mathcal{L}_{\text{eff}} = \sum_{n} \frac{f_n}{\Lambda^2} \mathcal{O}_n$
- Operators constrained by $SU(2) \times U(1)$ symmetry:

$$\mathcal{C} \supset \frac{\bar{c}_{H}}{2v^{2}} \partial^{\mu} [\Phi^{\dagger}\Phi] \partial_{\mu} [\Phi^{\dagger}\Phi] + \frac{g'^{2} \bar{c}_{\gamma}}{m_{W}^{2}} \Phi^{\dagger}\Phi B_{\mu\nu} B^{\mu\nu} + \frac{g_{s}^{2} \bar{c}_{g}}{m_{W}^{2}} \Phi^{\dagger}\Phi G_{\mu\nu}^{a} G_{a}^{\mu\nu}$$

$$+ \frac{2ig \bar{c}_{HW}}{m_{W}^{2}} [D^{\mu}\Phi^{\dagger}T_{2k}D^{\nu}\Phi] W_{\mu\nu}^{k} + \frac{ig' \bar{c}_{HB}}{m_{W}^{2}} [D^{\mu}\Phi^{\dagger}D^{\nu}\Phi] B_{\mu\nu}$$

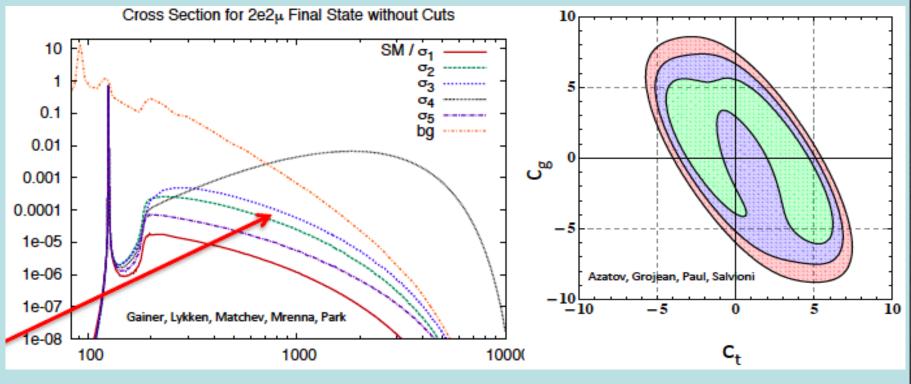

$$+ \frac{ig \bar{c}_{W}}{m_{W}^{2}} [\Phi^{\dagger}T_{2k}\overleftrightarrow{D}^{\mu}\Phi] D^{\nu} W_{\mu\nu}^{k} + \frac{ig' \bar{c}_{B}}{2m_{W}^{2}} [\Phi^{\dagger}\overleftrightarrow{D}^{\mu}\Phi] \partial^{\nu} B_{\mu\nu}$$

$$+ \frac{\bar{c}_{t}}{v^{2}} y_{t} \Phi^{\dagger}\Phi \Phi^{\dagger} \cdot \bar{Q}_{L} t_{R} + \frac{\bar{c}_{b}}{v^{2}} y_{b} \Phi^{\dagger}\Phi \Phi \cdot \bar{Q}_{L} b_{R} + \frac{\bar{c}_{\tau}}{v^{2}} y_{\tau} \Phi^{\dagger}\Phi \Phi \cdot \bar{L}_{L} \tau_{R}$$

• Constrain with precision EW, Higgs data, TGCs ...

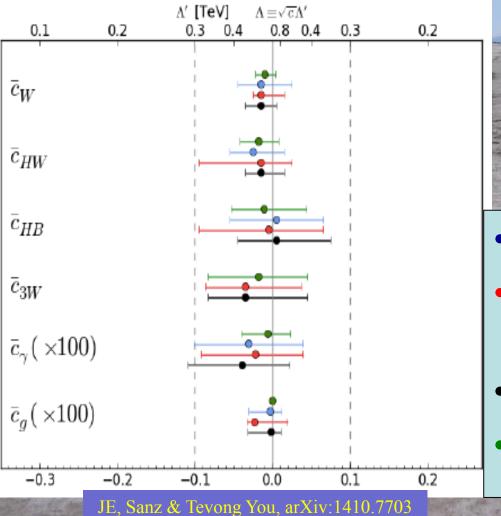

Off-Shell Higgs Production & $\Gamma_{\rm H}$

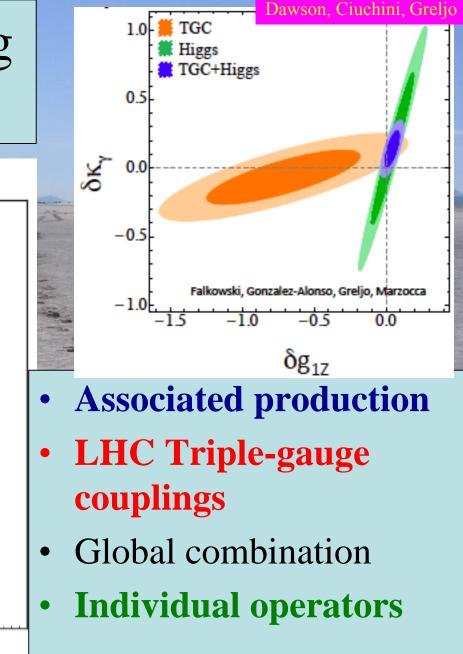

- Farrington, Dawsor
- If off-shell couplings = on-shell: $\Gamma_{\rm H} < 5.4, 5.5 \times \text{SM}$
- BUT: beware higher-dimensional operators in EFT

EFT coefficients constrained by combination

Global Fits including LHC TGCs

How do we achieve our goal?

Beyond SM: SUSY, relaxion, twin-Higgs, composite, ...

Standard Model EFT

Higgs: CP, κ_{v.f}, flavour violation, ...

Electroweak: sin²θ, TGCs, ...

Flavour: Top, CKM, anomalies, ...

Models?

Neutrinos:

CP, hierarchy, ...

QCD: soft, heavy ions, PDFs, hard, ...

« Empty » space is unsta SUSY

IS Not

SUSY SUSY

SUSY SUSY SUSY

The Standard Model

Theoretical Constraints on Higgs Mass

• Large $M_h \rightarrow$ large self-coupling \rightarrow blow up at

 Small: renormalization due to t quark drives quartic coupling < 0 at some scale Λ
 → vacuum unstable

 $\lambda(Q) = \lambda(v) - \frac{3m_t^4}{2\pi^2 v^4} \log \frac{Q}{v}$

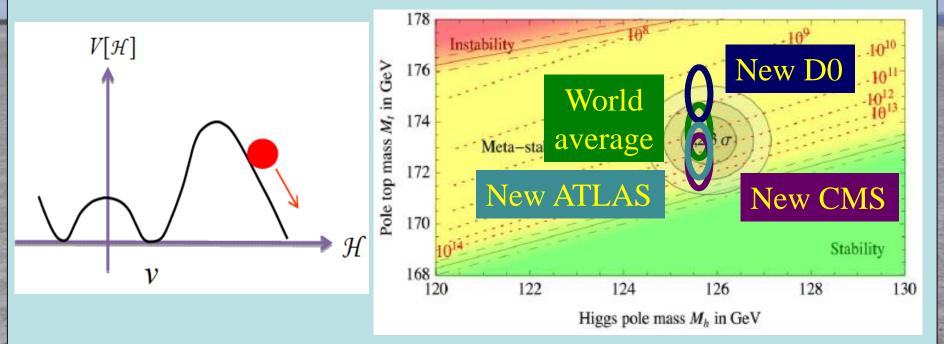

- 0.10 Instability (a) 0.08 $10^{11.1 \pm 1.3}$ GeV Higgs quartic coupling $\lambda(\mu)$ 0.06 0.04 0.02 $M_{r} = 171.0 \text{ GeV}$ 0.00 -0.02 $\alpha_s(M_Z) = 0.1163$ $M_{*} = 175.3 \text{ GeV}$ -0.041010 1012 1014 1016 1018 1020 10^{2} 104 108 RGE scale μ in GeV
- Vacuum could be stabilized by **Supersymmetry**

Degrassi, Di Vita, Elias-Miro, Giudice, Isodori & Strumia, arXiv:1205.6497

Vacuum Instability in the Standard Model

Melnikov, Mever

• Very sensitive to m_t as well as M_H

• Instability scale: Buttazzo, Degrassi, Giardino, Giudice, Sala, Salvio & Strumia, arXiv:1307.3536

$$\log_{10} \frac{\Lambda_I}{\text{GeV}} = 11.3 + 1.0 \left(\frac{M_h}{\text{GeV}} - 125.66 \right) - 1.2 \left(\frac{M_t}{\text{GeV}} - 173.10 \right) + 0.4 \frac{\alpha_3(M_Z) - 0.1184}{0.0007}$$
$$\mathbf{m}_t = \mathbf{173.3} \pm \mathbf{1.0} \text{ GeV} \Rightarrow \log_{10}(\Lambda/\text{GeV}) = \mathbf{11.1} \pm \mathbf{1.1}$$

• Do inflation fluctuations drive us over the hill?

- Then Fokker-Planck evolution
- Do AdS regions eat us?
 - Disaster if so
 - If not, OK if more inflation

OK if dim-6 operator? Non-minimal gravity coupling?

SUSY: Dusk or Dawn?

What lies beyond the Standard Model?

Supersymmetry

Stabilize electroweak vacuum

New motivations From LHC Run 1

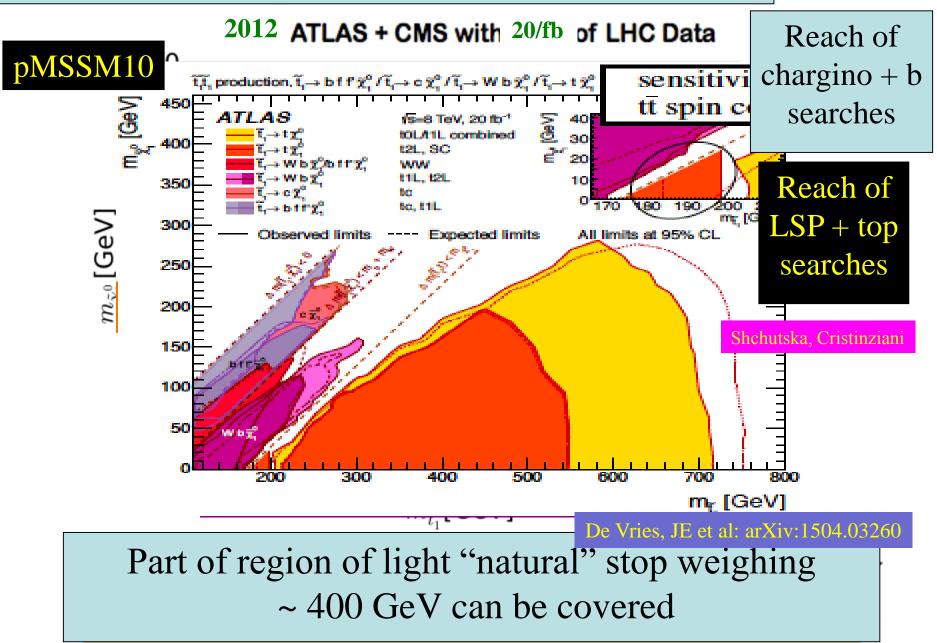

- Successful prediction for Higgs mass
 Should be < 130 GeV in simple models
- Successful predictions for couplings

 Should be within few % of SM values
- Naturalness, GUTs, string, ..., dark matter

'... better known, and still well-motivated ... MSSM"

Exploring Light Stops @ Run 2

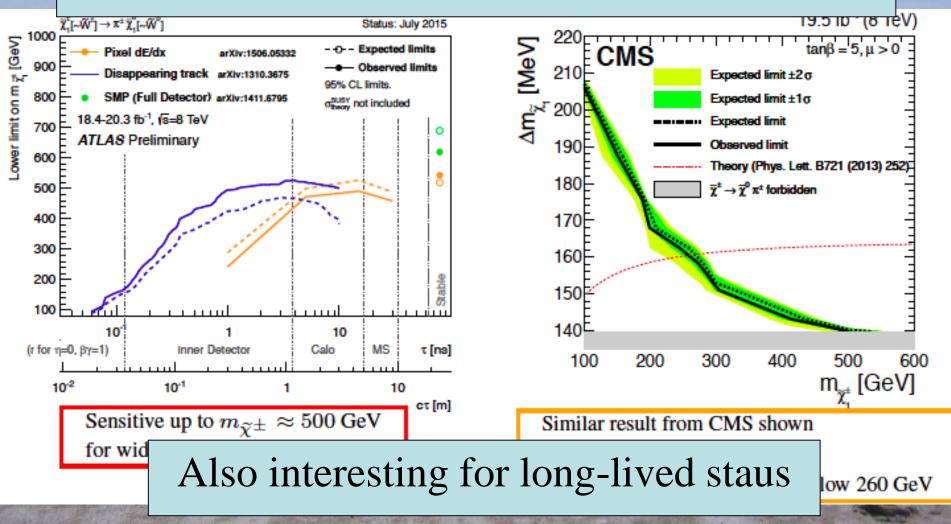

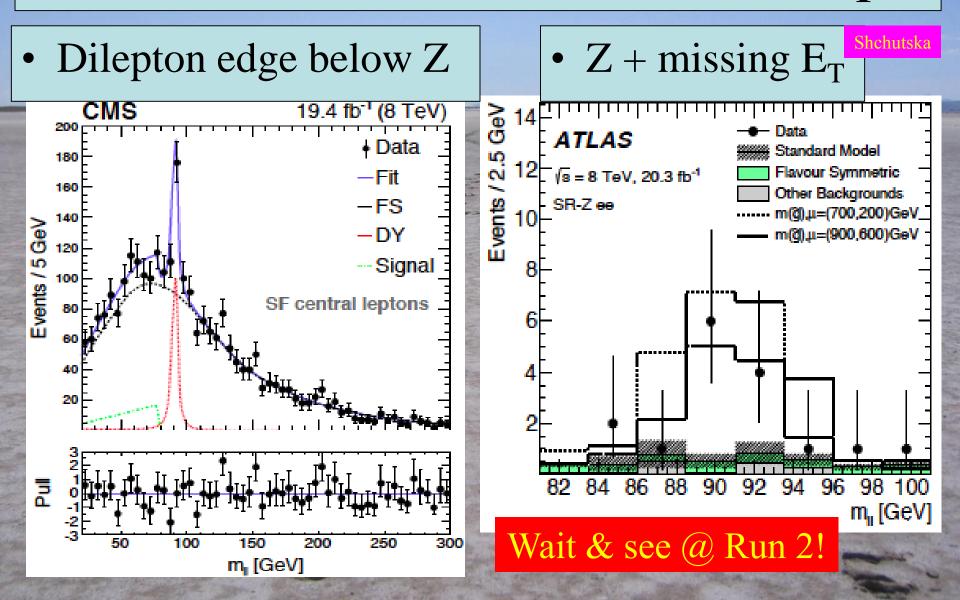

Searches for Long-Lived Sparticles

- ν-less ββ decay

0.8 O

0.6

0.4

0.2

0

2

90% up. lim.

Upper limit on **m**_v

Novel Idea # 1: "Twin Higgs"

- Higgs sector links 2 copies of Standard Model:
- $V_{\text{Higgs}} = \lambda \left(|H_A|^2 + |H_B|^2 \right)^2$ • SM quadratic divergences cancelled by SMneutral particles: "neutral naturalness"
- Postulate negative mass² in SM_B sector

 $SU(4) \rightarrow SU(3) \Rightarrow 7 \times \pi$

• "our" Higgs is pseudo-Nambu-Goldstone boson

 $(3 \times \pi) \Rightarrow W_B, Z_B$

 $(4 \times \pi) \Rightarrow \begin{pmatrix} H^{\pm} \\ H^{0} \end{pmatrix}$

- Novel LHC phenomenology
 - − Higgs → B-sector glueballs? Displaced vertices?

Novel Idea # 2: "Relaxion"

• Add "axion-like" field to Standard Model

$$\mathcal{L} \sim (M^2 - g \check{\phi}) |H| - g M^2 \phi + f_\pi^3 \lambda_q \langle h
angle \cos \left(rac{\phi}{f}
ight)$$

- Chiral symmetry breaking potential
- Depends on quark mass, hence Higgs vev
- Evolution of "axion-like" field
- Gets trapped with non-zero vev
- Also Higgs vev, naturally small
- 10⁴⁰ inflation efolds, $\theta_{\text{QCD}} \neq 0$!!
- Need epicycles (new QCD', ...)

Composite Vector (Gauge) Bosons?

- Massless spin-1 bosons can be composite
 - Explicit supersymmetric example:
 - $SU(4) + 64 + 4bar \rightarrow SU(2) + 122$ fermions + 321 scalars
- Example of strong-weak duality, proof uses

 $(p,p)^{2}(q,q)^{2}\int\prod_{i=1,\dots,4}[dr_{i}]\frac{\prod_{i,j\leq4}\Gamma(\mu_{i}r_{j},1/(\tilde{\mu}_{i}r_{j}),p,q)}{\prod_{i,j\leq4}\Gamma(r_{i}/r_{j},r_{j}/r_{i},p,q)}$

$$= \left[\prod_{i,j\leq 2} \Gamma(\mu_i/\tilde{\mu}_j, p, q)\right] \int \prod_{i=1,2} [dr_i] \frac{\prod_{i,j\leq 2} \Gamma(\mu_i r_j, 1/(\tilde{\mu}_i r_j), p, q)}{\prod_{i,j\leq 2} \Gamma(r_i/r_j, r_j/r_i, p, q)}$$

Elliptic hypergeometric Gamma functions and q-Pochhammer symbols

- Applicable to ρ meson of QCD?
- Applicable to gauge bosons of Standard Model?
- "No experimental motivation" Look for it!

How do we achieve our goal?

Cosmology & Astrophysics: inflation, dark matter, cosmic rays, grav. waves, ...

Neutrinos:

CP, hierarchy, ...

Beyond SM: SUSY, relaxion, twin-Higgs, composite, ...

Standard Model EFT

Higgs: CP, κ_{y,f}, flavour violation, ...

Electroweak: sin²θ, TGCs, ...

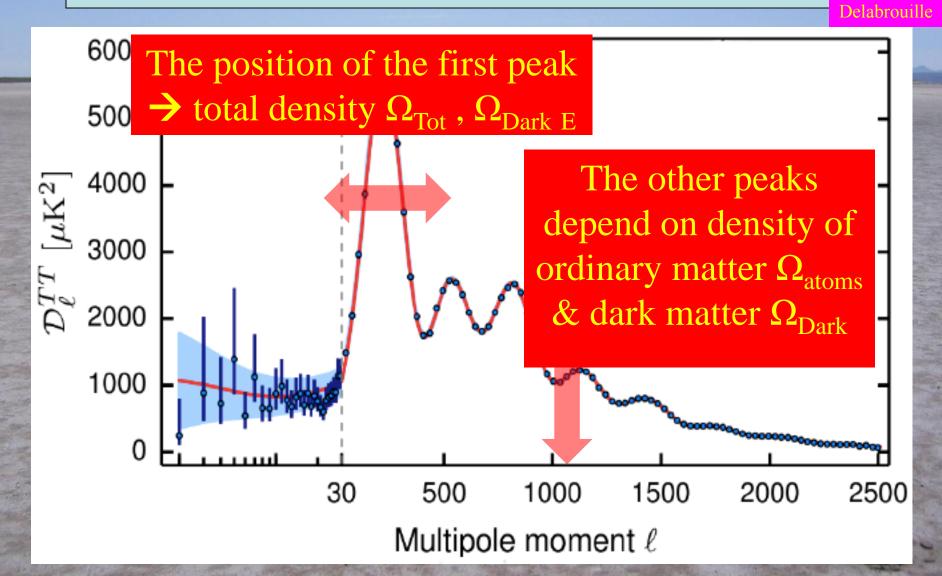

Flavour: Top, CKM, anomalies, ...

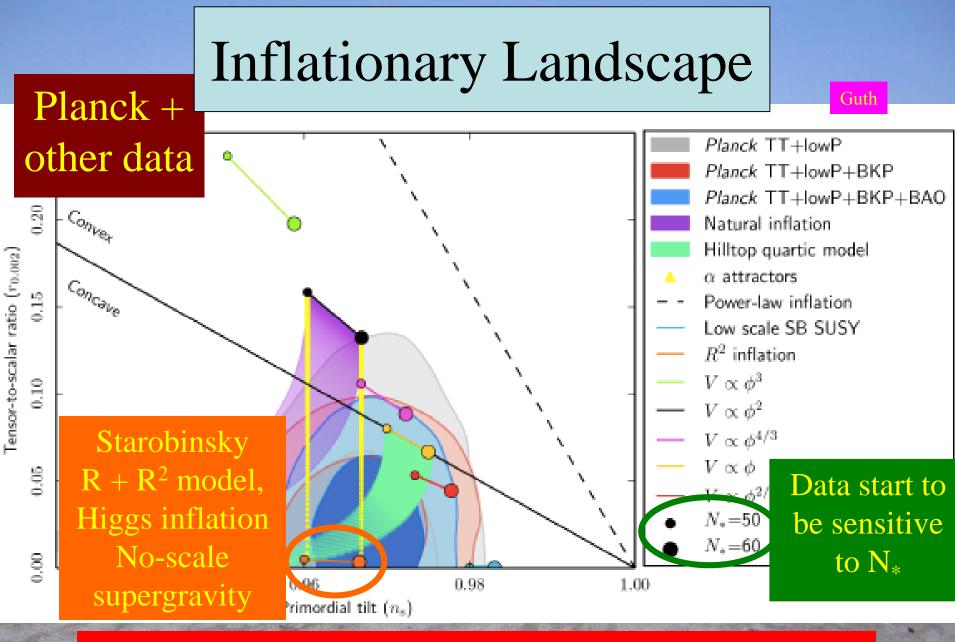

Models?

QCD: soft, heavy ions, PDFs, hard, ...

The Spectrum of Fluctuations in the Cosmic Microwave Background
