

- **GOCDDB**

- DB replica DONE:

- Oracle Materialized Views: daily refresh (definitive frequency TBD)
 - Tested: produced a TOP-BDII site list, identical to the one from RAL DB

- TODO:

- ITWM backup web front-end to be connected with backup DB
 - Test LDAP connection strings: to be widely used by GOCDDB customers, to transparently trigger the switch from master to replica

- Thanks to Osman@IN2P3 and Keir@RAL for Materialized Views and LDAP idea

- **CIC Portal**

- Expolit GOCDDB experience for CIC Portal DB, as discussed with Gilles at last COD meeting

- **Main missing points**

- Gridops.org:

- Automatization of switch mechanism
 - Definition of when the switch should happen (for every different tool)
 - Definition of new views of the tools through gridops.org (e.g. CIC portal + GOCDDB)

- Coordination between Oracle based tools, and their customers, to use an efficient access to instances and replicas (see LDAP?)

- **Future, towards EGI**

- Tools local to NGIs: failover/availability is delegated locally

- Some failover activity could remain, maybe taking care of:

- Failover of tools that are still centrally provided
 - Some coordination of interactions between central tools and NGI tools
 - Both to be defined probably with OAT
