Status of SuperKEKB commissioning and Belle II detector construction (15' + 5')

Friday, 5 August 2016 09:20 (20 minutes)

The SuperKEKB energy-asymmetric e^+e^- collider has now started commissioning and is working towards its design luminosity of $8 \times 10^{35} \text{ cm}^{-2} \text{ s}^{-1}$. The collisions will be recorded and analyzed with the Belle II spectrometer, the construction of which is on-going at the roll-out position. Highlights will include the outcome of Phase I commissioning of the SuperKEKB accelerator, BEASTII background commissioning and the most recent progress on the construction of the Belle II detector.

Presenter: LEWIS, Peter (University of Hawaii)
