

# MSSM neutral Higgs bosons search with the ATLAS detector at LHC

**Simonetta Gentile**

Università di Roma, La Sapienza, INFN

on behalf of ATLAS Collaboration

Simonetta Gentile, Engin Arik's memorial, October 27-31 2008, Istanbul.

- ✦ Motivation
- ✦ Supersymmetric (SUSY) Higgs
- ✦ Signal production and properties
- ✦ Among all channels studied from ATLAS  
focus on :
  - ✦  $h/A/H \rightarrow \mu\mu$
  - ✦  $h/A/H \rightarrow \tau\tau$
  - ✦  $A/H \rightarrow \chi^0_{2,3,4} \chi^0_{2,3,4}$  and  $A/H \rightarrow \chi^+_2 \chi^-_{1,2}$
- ✦ Conclusions

New

New results from recent  
detailed simulation

# ATLAS detector

- 46 m length, 24 m diameter
- 7000 t weight
- 3000 km cables

Trigger:  
 $10^9 \text{ Hz} \Rightarrow 75 \text{ kHz} \Rightarrow 100 \text{ MB / s storage}$

Detector component	Resolution	$\eta$ coverage
Tracking	$\sigma / p_T = 0.05 \% p_T \text{ [GeV]} \oplus 1 \%$	$ \eta  < 2.5$
EM calorimetry	$\sigma / E = 10 \% / \sqrt{E \text{ [GeV]}} \oplus 0.7 \%$	$ \eta  < 2.5$
Hadronic calo: Barrel	$\sigma / E = 50 \% / \sqrt{E \text{ [GeV]}} \oplus 3 \%$	$1.5 <  \eta  < 3.2$
Forward	$\sigma / E = 100 \% / \sqrt{E \text{ [GeV]}} \oplus 10 \%$	$3.1 <  \eta  < 4.9$
Muon spectrometer	$\sigma / p_T = 2.3 \% (p_T = 50 \text{ GeV})$	$ \eta  < 2.7$

The MSSM is the most investigated extension of SM provides:

- The unification of coupling constants
- SUSY provides a ColdDarkMatter candidate
- **Three neutral Higgs bosons:  $A$ , CP-odd, and CP-even  $H, h$  the lightest. Two charged  $H^+$ , and  $H^-$ .**
- **Large loop corrections depend on SUSY parameters**

Unconstrained MSSM has huge number (105) of parameters in addition SM ones, making any phenomenological analysis very complicated

- A **simplified version** at some GUT scale: CMSSM/mSUGRA  
Most of phenomenological analysis models are based on that.

- ★  $M_{\text{susy}}$ , sfermion mass at EW scale
- ★  $M_2$ ,  $SU(2)_L$  gaugino mass at EW scale
- ★  $\mu$ , supersymmetric Higgs boson mass parameter.
- ★  $\tan \beta$ , the ratio of the two Higgs fields doublets
- ★  $A_0$ , a universal trilinear higgs-squarks coupling at EW scale. It is assumed to be the same for up-type squarks and for down types quarks.
- ★  $m_A$ , mass of CP-odd Higgs boson.
- ★  $M_{\text{gluino}}$ , it affects loop corrections for stop and bottom

Phenomenology  
described at Born  
level by  $\tan \beta, m_A$

➤ couplings:  $g_{\text{MSSM}} = \xi \cdot g_{\text{SM}}$   
no coupling of A to W/Z  
large  $\tan \beta$ : large  
BR( $h, H, A \rightarrow \tau\tau, bb$ )

$\xi$	$t$	$b/\tau$	W/Z
$h$	$\cos \alpha / \sin \beta$	$-\sin \alpha / \cos \beta$	$\sin(\alpha - \beta)$
$H$	$\sin \alpha / \sin \beta$	$\cos \alpha / \cos \beta$	$\cos(\alpha - \beta)$
$A$	$\cot \beta$	$\tan \beta$	-----

$\alpha$ : mixing angle between CP even Higgs bosons  
(calculable from  $\tan \beta$  and  $M_A$ )

- ★ For  $M_A < 135$  GeV ( $M_h^{\max}$  scenario)
- ★ The light MSSM Higgs is SM-like

$$M_A \approx M_h$$

# Masses

- ★ For  $M_A > 150$  GeV (decoupling limit)

The heavy MSSM Higgs:

$$M_A \approx M_H \approx M_{H^\pm}$$

Sven Heinemeyer  
 Atlas meeting 29.01.2008

Simonetta Gentile, Engin Arik's memorial, October 27-31 2008, Istanbul.

# MSSM Higgs Production

$$V^* = W/Z$$

- Main production mechanism  $\sim$  SM
- For high and moderate  $\tan\beta$  the production with b quarks is enhanced
- For  $m_A \gg m_Z$  A/H behave very similar  $\rightarrow$  decoupling region
- A, H,  $H^\pm$  cross section  $\sim \tan\beta^2$

# Production cross section

$\Phi = h, H, A$

- At small  $\tan\beta$   $gg \rightarrow h, H, A$  dominant
- Vector boson fusion process  $pp \rightarrow qq \rightarrow qq + WW/ZZ \rightarrow qq + h/H$  important at  $m_h \sim m_{hmax}$
- Higgsstrahlung negligible
- At **high  $\tan\beta$  associated b quarks production dominates**  
 **$pp \rightarrow bb \rightarrow h/H/A + bb$**

Abdelhak Djouadi arXiv:hep-ph/0503173v2 (2005)

Simonetta Gentile, Engin Arik's memorial, October 27-31 2008, Istanbul.

# Branching ratio

## •Decoupling region

$M_A \geq 150 \text{ GeV} \quad \tan\beta \approx 30$   
 or  $M_A \geq 400\text{-}500 \text{ GeV} \quad \tan\beta = 3$

## Production rate

$$\Gamma(h, H, A) \propto m_f^2$$

- Decay  $bb$  dominates,  $\tau\tau$  lower background
- weaker sensitivity on SUSY parameters

Abdelhak Djouadi arXiv:hep-ph/0503173v2 (2005)

Simonetta Gentile, Engin Arik's memorial, October 27-31 2008, Istanbul.

# Branching ratio

- Intense coupling region  $\tan\beta \approx 30$   $M_A \sim 120-140$  GeV
- Coupling to W,Z up quarks suppressed
- Coupling down quark (b) and  $\tau$  enhanced

- Decay  $bb$ ,  $\tau\tau$  dominates
- Decay  $\mu\mu$  possible

# Benchmark scenarios

- ★  **$m_h^{\max}$  scenario**

It allows the maximum value for  $m_h$  ( $X_t = 2M_{\text{SUSY}}$ ).

It can be obtained conservative  $\tan\beta$  exclusion bounds

- ★ **no-mixing scenario**

No mixing in scalar top sector ( $X_t = 0$ )

- ★ **small  $\alpha_{\text{eff}}$  scenario**

Hb coupling  $\sim \sin \alpha_{\text{eff}} / \cos \beta$  can be zero:  $\alpha_{\text{eff}} \rightarrow 0$ :

Main decay mode vanishes, important search channel vanishes

- ★ **gluophobic Higgs scenario**

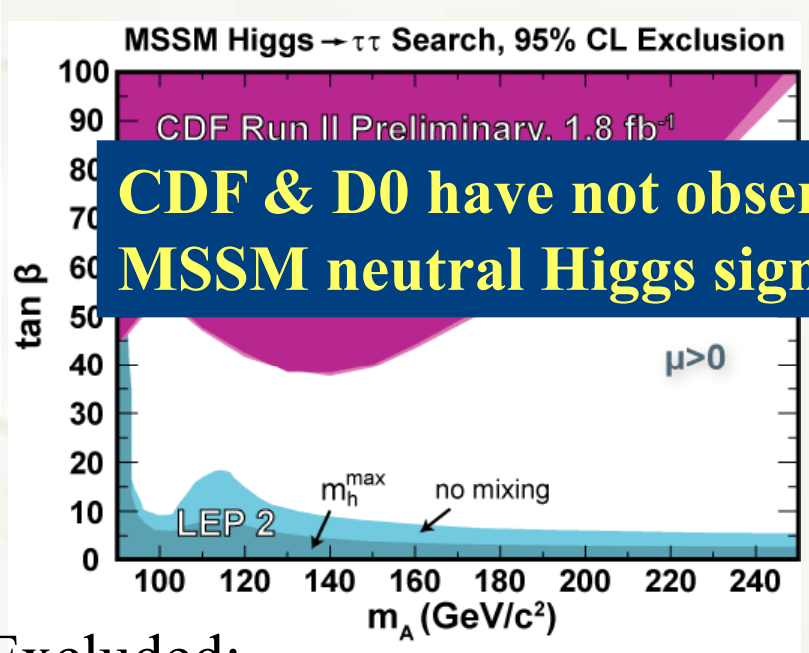

hgg coupling is small: main LHC production mode vanishes.

# Exclusion Limit from LEP And Tevatron

**High  $\tan\beta$  area for search at LHC with  $pp \rightarrow bb$   $h/H/A$   $h/H/A \rightarrow \mu\mu, \tau\tau$  decays**

**CDF & D0 have not observed a MSSM neutral Higgs signal yet**

Excluded:

( $m_h^{\max}$  scenario)  
 $m_h > 92.8$  GeV  
 $m_A > 93.4$  GeV

$\tan\beta$  0.7 2.0  
 Excluded

S. Lowette ICHEP 2008

Arik's memorial, October 27-31 2008, Istanbul.

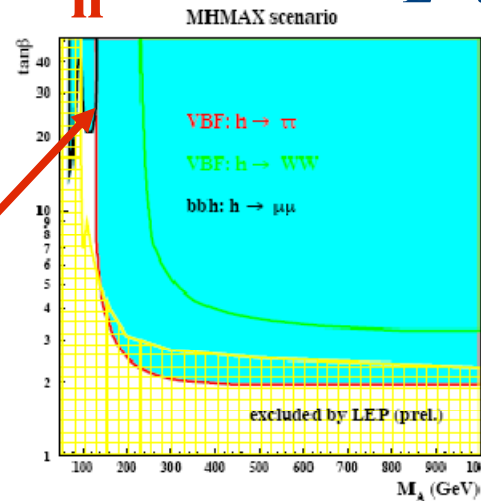

# Light higgs boson

- VBF dominates at low luminosity
- Large space covered by several channel
- Region around  $m_h \sim 95\text{GeV}$  difficult
- $h \rightarrow \mu\mu$  channel at low masses

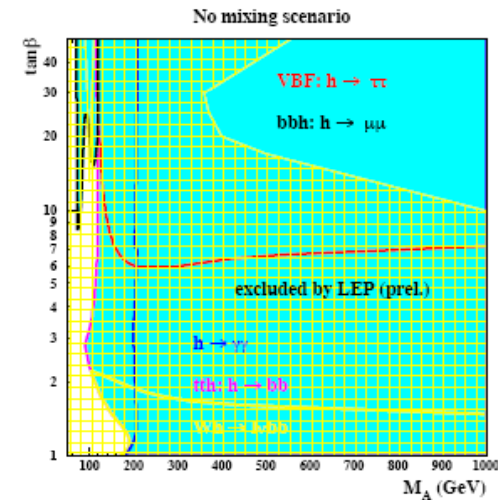

$h/A/H$

**h**  $L = 30\text{fb}^{-1}$

$L = 300\text{fb}^{-1}$

**NOT UPDATED**

# $bb \ h/A \rightarrow bb \mu\mu$

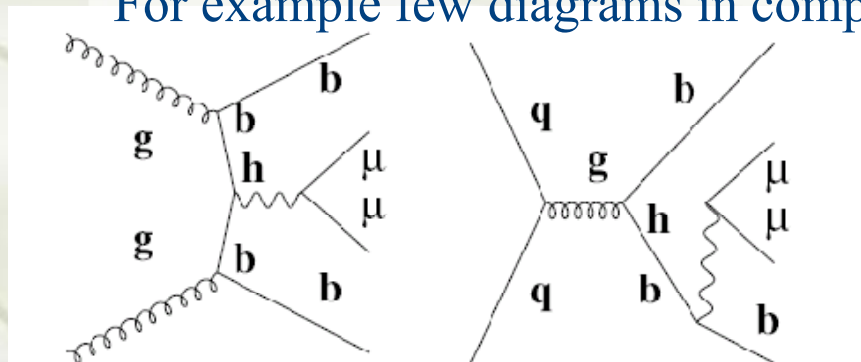

- Associated  $h/A/H$  production with  $b$ -jets  $\rightarrow$  large  $\sigma$
- The advantage of  $\tau\tau$  channel due to the mass is counterbalanced by difficulty of identify  $\tau$  decays
- Excellent  $\mu$  resolution of detectors

(smaller detector acceptance,  $\nu$  in final state)

Production  
 $h \rightarrow \mu\mu$  and  
 $\rightarrow \tau\tau$

For example few diagrams in comparison:

signal

background

S.G., H.Bilokon, V.Chiarella, G.Nicoletti, Eur.Phys. J. C. 52, 229-245 (2007)

# Background evaluation

- ★  $bbZ \rightarrow bb\mu\mu$  large cross section ( $\sigma \approx 22.8$  pb) large theoretical uncertainties ( $\approx 25\%$ )

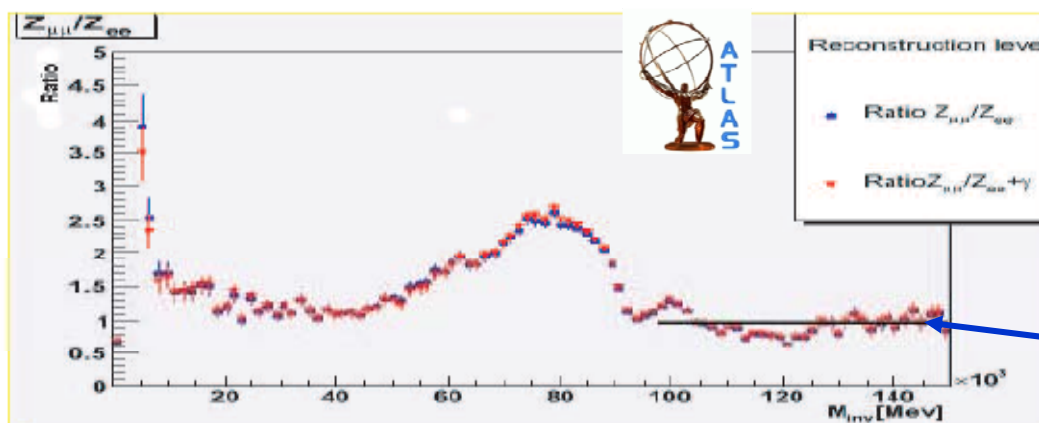

Proposed **data driven method** based on  $bbZ \rightarrow bbee$

- ★ Rate of signal suppressed by  $\left(\frac{m_\mu}{m_e}\right)^2$

**Background** same rate:

**same** production diagram, and lepton universality

**different** inner bremsstrahlung and detector reconstruction

Ratio stable & without large corrections factor

ATL-PHYS-PUB-2006-019  
03 July 2006

# $bbh/A\mu\mu$ low mass region

$M_A = 110.31$  GeV,  $M_h = 110$  GeV,  $\tan\beta = 45$

LO order cross section

Atlas :  $\tan\beta$  15-50

$m_A$  95-130 GeV

- $2 \mu$   $p_T > 20 \text{ GeV}$
- 2 jets  $p_T > 10 \text{ GeV}$
- 1 b-jet ( $p_T > 15 \text{ GeV}$ )
- $M_{\mu\mu}$
- $\mu$ -isolation, no hadronic activity

Full detector simulation

Corresponding to  $L = 300 \text{ fb}^{-1}$

- Background  $bbZ \rightarrow bb\mu\mu$
- $tt \rightarrow bb\mu\mu$
- $ZZ \rightarrow bb\mu\mu$

• good muon momentum resolution makes Higgs mass peak stand out on a falling background

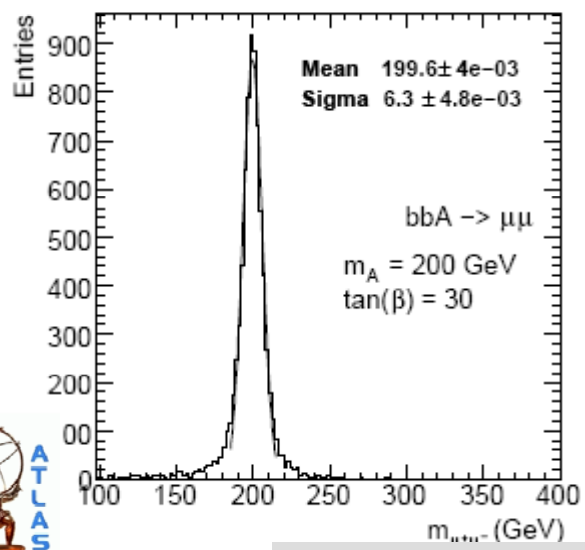

# Discovery contours

$5\sigma$  at  $L = 30 \text{ fb}^{-1}$

ATLAS

- In the region  $M_A < 135 \text{ GeV}$   
neutral MSSM Higgs production  
is dominated by  $h/A$
- In the region  $M_A > 135 \text{ GeV}$   
the production is dominated by  $H/A$

# */H higher mass range*

- using NLO  $\sigma$
- Z+udcs background

$\tan\beta = 30$

ATLAS Collaboration,  
 Expected Performance of the ATLAS Experiment,  
 Detector, Trigger and Physics,  
 CERN-OPEN-2008-020, Geneva, 2008, to appear.

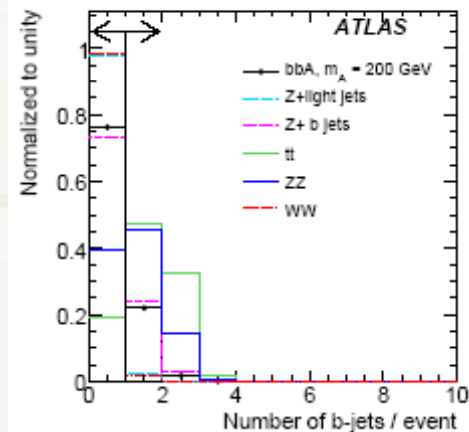

• Preselection : Trigger One  $\mu$  with  $p_T > 20$  GeV and 2,  $p_T^{\mu} > 20$  GeV

$E_T^{\text{miss}} < 40$  GeV

b-tag weight  $> 4$

a) O-b-jet b)  $\geq 1$  b-jet

preliminary

b)  $\geq 1$  b-jet

preliminary

$|\sin \Delta\phi_{\mu\mu}| < 0.75$

$\sum P_T^{\text{jet}} < 90$  GeV

# High mass analysis

- Analysis divided in two independent branches:
- A) events with **0 reconstructed b-jets in final state**
- B) events with **at least one reconstructed b-jet in the final state.**
- Final discovery A)+B)**
- Signal events considered in  $\Delta m = m_A \pm 2\sigma_{\mu\mu}$
- Background sideband estimation from data

preliminary

0-bjets

A+H

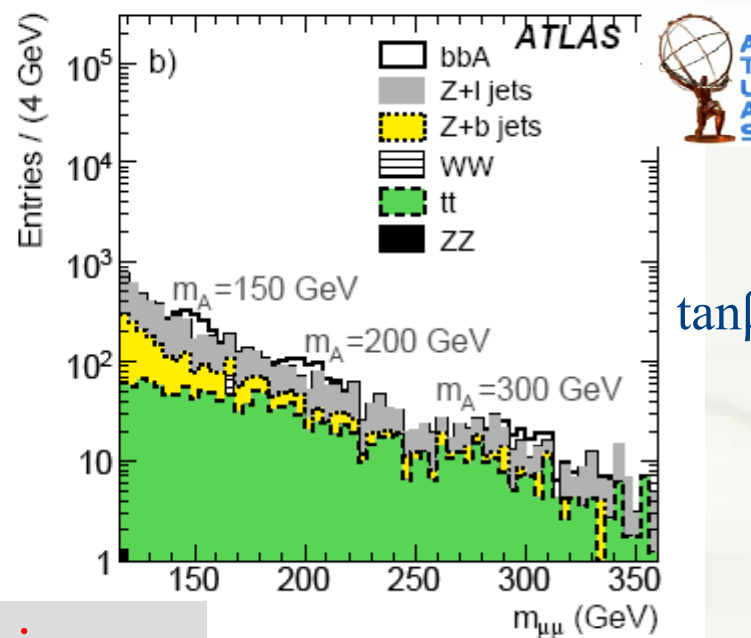

$\geq 1$ b-jet

Z+jets dominating

preliminary

$t\bar{t}$  Z+jets dominating

$\tan\beta = 30$   $L = 30 \text{ fb}^{-1}$

- Signal cross section uncertainties 17%
  - Systematic experimental uncertainties based on detector expected performances: e.g. muon efficiency, muon PT scale, muon resolution, Jet energy scale, Jet energy resolution, btag efficiency, b-tagging fake rate.
- Based on detector expected performance 10-20%

**Large systematic uncertainties demand for data-driven method background estimation**

preliminary

Combined 0-b-jet and  $\geq 1$  b-jet analysis

preliminary

# $bb H/A \rightarrow bb \tau\tau$

➤ High rate but difficult from background

➤  $bb H/A \rightarrow bb \tau\tau$  covers large  $\tan\beta$  region

➤ **Hadron/leptonic:**  $bbH \rightarrow bb\tau\tau \rightarrow e/\mu + \text{jet} + E_T^{\text{miss}}$

Higher rate of full leptonic channel

(lepton  $\text{Br}(\tau \rightarrow \ell \nu_\tau \nu_\ell) \sim 0.17$ )

- easier detection of full hadronic channel
- good coverage of MSSM parameter space.

➤ **Full leptonic:**  $bbH \rightarrow bb\tau\tau \rightarrow e\mu + E_T^{\text{miss}}$

Lower rate than full hadronic or

hadronic/lepton  $\text{Br}(\tau \rightarrow \ell \nu_\tau \nu_\ell) \sim 0.17$

clean signal and easy to trigger

• Discussion on full leptonic channel

**New**

di Fisica Nucleare

## Higgs mass reconstruction using collinear approximation

- Approximation method requires **excellent missing  $E_T$  resolution**
- Main background:  $Z$ +jet,  $t\bar{t}$ ,  $Zbb$

### Analysis:

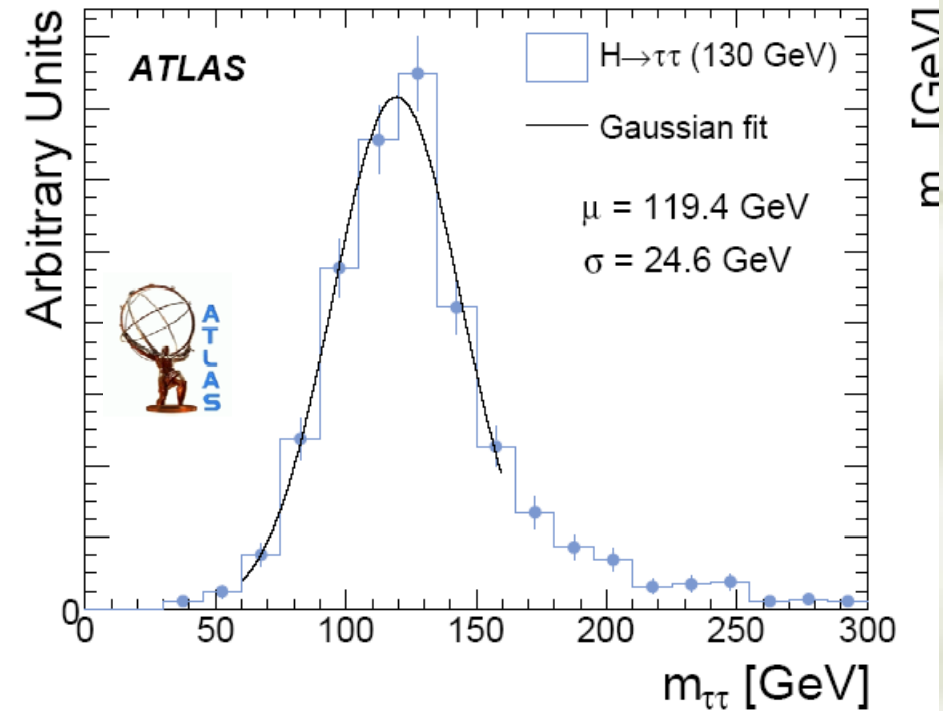

- Trigger Single or dilepton
- At least one b-tagged jet
- $N_{jet} < 3$  cut  $t\bar{t}$  background
- Dilepton-mass and missing energy cut to veto  $Z \rightarrow ee$  and  $Z \rightarrow \mu\mu$
- $E_T^{Miss}$
- $\Delta\Phi_{\ell\ell}$
- $Z \rightarrow \tau\tau$  estimated from data
- Asymmetric mass window cut

ATLAS Collaboration,  
Expected Performance of the ATLAS Experiment,  
Detector, Trigger and Physics,  
CERN-OPEN-2008-020, Geneva, 2008, to appear.

$$bb \ H/A \rightarrow bb \ \tau\tau \rightarrow \ell \ell$$

preliminary

$$x = p_{T,\ell} / p_{T,\tau}$$

$$0 < x < 1$$

$$m_{\tau\tau} = \frac{m_{\ell\ell}}{\sqrt{x_1 \cdot x_2}}$$

# $bb H/A \rightarrow bb \tau\tau \rightarrow \ell\ell$

## RESULTS

- Low  $M_A$  Range :  $Z \rightarrow \tau\tau$  dominant background
- High  $M_A$  range:  $t\bar{t}$  background dominant
- Dominat Systematic Uncertainties**
- Jet Energy scale/resolution
- b-tag efficiencies

$L = 30 \text{ fb}^{-1}$

preliminary

preliminary

$$x = p_{T,\ell} / p_{T,\tau}$$

$$0 < x < 1$$

$$m_{\tau\tau} = \frac{m_{\ell\ell}}{\sqrt{x_1 \cdot x_2}}$$

# $bb H/A \rightarrow bb \tau\tau \rightarrow \ell\ell$

★ **Discovery of Higgs boson in the  $m_h^{\max}$  scenario is possible** for  $m_A = 150$  GeV and  $\tan\beta > 20$ , for  $m_A = 275$  GeV  $\tan\beta > 35$  and  $m_A > 300$  GeV for  $\tan\beta > 45$  with integrated  $L = 30\text{fb}^{-1}$ .

# *SUSY & Higgs interplay*

If SUSY kinematically accessible, then real production of sparticles.

★ Higgs can decay directly to or come from decay of SUSY particles

- ★ Associated production modes: e.g, squark-squark-Higgs
- ★ SUSY particles suppress or enhance loop induced production or decays Higgs into sparticle decay modes can compete with SM modes:

$$H/A \rightarrow \chi^0_2 \chi^0_2 \rightarrow 4 \ell^\pm X$$

$$H^\pm \rightarrow \chi^0_2 \chi^\pm_1 \rightarrow 3 \ell^\pm X$$

# Choice of Bench mark points

To choose **representative points** in the search

$$A/H \rightarrow \chi_i^0 \chi_i^0 \rightarrow 4 \ell$$

The following characteristics

➤ “High” branching ratio in

$$\begin{aligned} & \chi_2^0 \chi_2^0 \\ & \chi_{2,3,4}^0 \chi_{3,4}^0 \\ & \chi_1^+ \chi_2^- \end{aligned}$$

➤ “High” branching ratio in

$$\chi_2^0 \rightarrow \chi_1^0 \ell^+ \ell^-$$

- ✦  $m_{\text{top}} = 175 \text{ GeV}$
- ✦  $m_b = 4.25 \text{ GeV}$
- ✦  $\tan \beta = 10$
- ✦  $m_A = 500 \text{ GeV}$
- ✦  $M_{\text{squark}} = 1 \text{ TeV}$
- ✦  $A_{\text{tau}} = 0$
- ✦  $A_\ell = 0$

**MSSM** representative Points

**MSugra** representative Points

**Point A**  $M_0 = 125 \text{ GeV}$   $\tan \beta = 20$

**Point B**  $M_0 = 400 \text{ GeV}$   $\tan \beta = 20$

$M_{1/2} = 165 \text{ GeV}$   $\text{sign}(\mu) = +1$   $A_0 = 0$

**Point 1**  $M_A = 500 \text{ GeV}$   $\tan \beta = 20$

$M_1 = 90 \text{ GeV}$   $M_2 = 180 \text{ GeV}$   $\mu = -500 \text{ GeV}$

$M_{\tilde{\tau}} = M_{\tilde{\tau}} = 250 \text{ GeV}$   $m_g = M_q = 1000 \text{ GeV}$

**Point 2**  $M_A = 600 \text{ GeV}$   $\tan \beta = 35$

$M_1 = 100 \text{ GeV}$   $M_2 = 200 \text{ GeV}$   $\mu = -200 \text{ GeV}$

$M_{\tilde{\tau}} = 150 \text{ GeV}$   $M_{\tilde{\tau}} = 250 \text{ GeV}$   $m_g = 800 \text{ GeV}$

$M_q = 1000 \text{ GeV}$

## ➤ Signal

$$H \rightarrow 4 \ell$$

$$A \rightarrow 4 \ell$$

## ➤ Standard Mode Background

- $bbZ \rightarrow 4 \ell$

- $tt \rightarrow 4 \ell$

- $ZZ \rightarrow 4 \ell$

## ➤ MSSM Background

$$\tilde{q}, \tilde{g}$$

$$\tilde{\ell}, \tilde{\nu}$$

$$\tilde{\chi}\tilde{\chi}, \tilde{q} / \tilde{g}\tilde{\chi}$$

$$tH^- + c.c.$$

→ 4  $\ell$

## Main selections:

- $\ell$  Isolation

- charge and flavour constraints  $l_1^- l_1^+ l_2^- l_2^+$

- Impact significance

- $35 \text{ GeV} < E_T^{\text{miss}} < 130 \text{ GeV}$

- Z veto :  $|\text{Minv}(\ell^+ \ell^-) - M_Z|$

- 1st high energy lepton  $p_T^{\ell 1}$ ,  
2nd high energy lepton  $p_T^{\ell 2}$

- $P_T^{\text{JetMin}} > 20 \text{ GeV}$

- $N_{\text{jet}} \leq 5 \quad P_T^{\text{jet}} > 20 \text{ GeV}$

(with 1 track)

## Reference points: ( same BKMM)

- 1) MSSM Point 1  $M_A = 500 \text{ GeV} \quad \tan\beta = 20$

- 2) MSSM Point 2  $M_A = 600 \text{ GeV} \quad \tan\beta = 35$

- 3) MSUGRA Point A  $\tan\beta = 20$

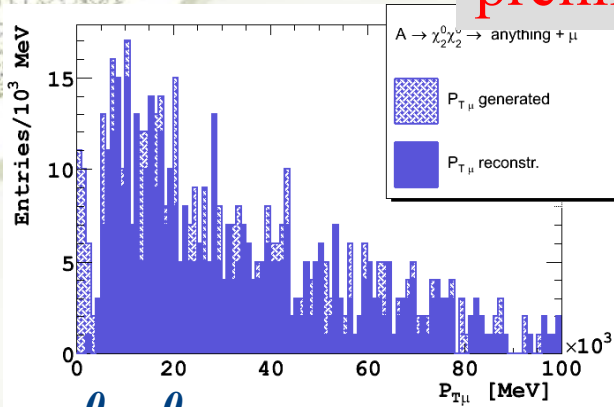

- 4) MSUGRA Point B  $\tan\beta = 20$

# Detector Performances

$$A \rightarrow \chi_2^0 \chi_2^0 \rightarrow \mu \mu$$

preliminary

$$A \rightarrow \chi_2^0 \chi_2^0 \rightarrow e e$$

$$A \rightarrow \chi_2^0 \chi_2^0 \rightarrow e e$$

$$t\bar{t} \rightarrow 4 \ell$$

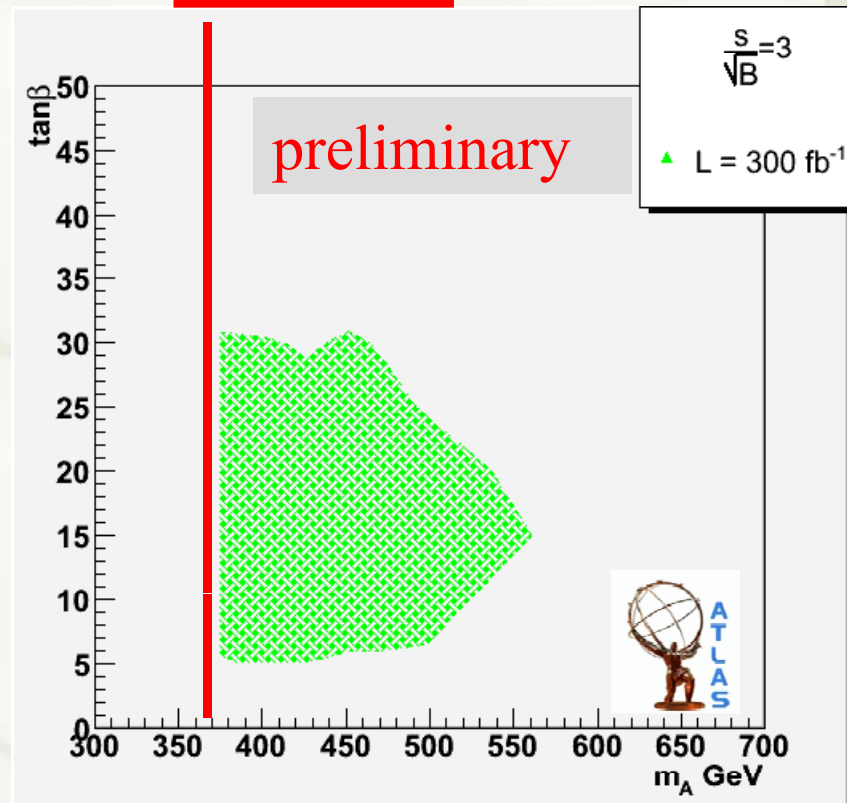

# Discovery plots at $L = 300 \text{ fb}^{-1}$

$$\tilde{\chi}_2^0 \tilde{\chi}_2^0$$

$$\tilde{\chi}_2^0 \tilde{\chi}_2^0$$

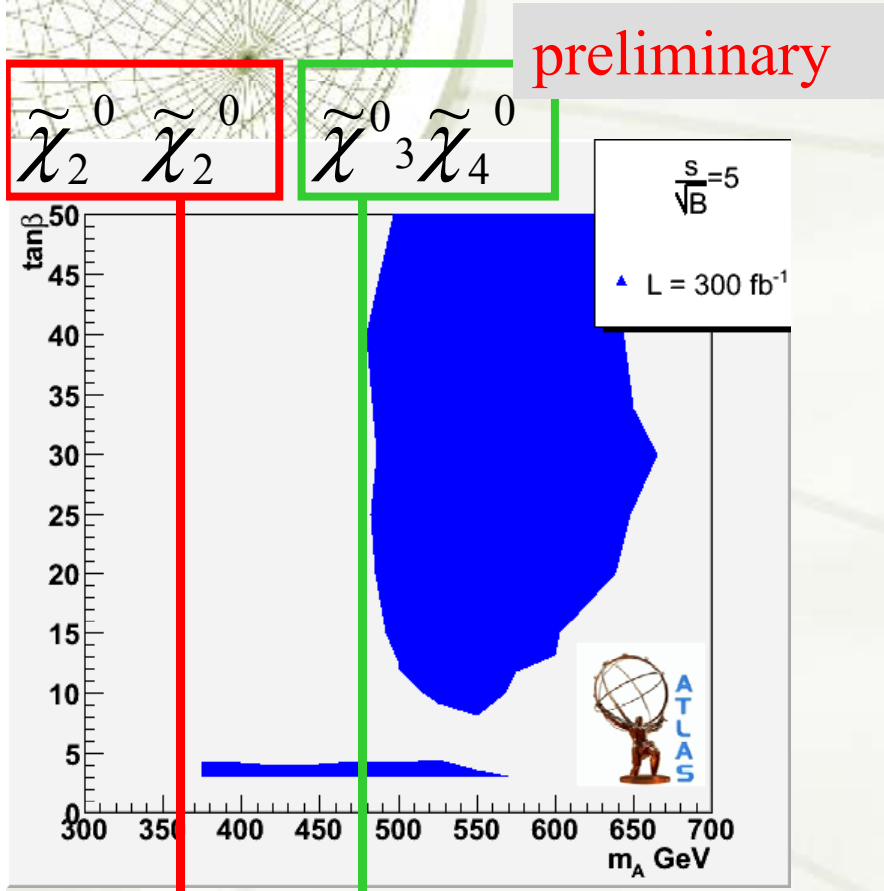

# Set 1 Discovery plots at $L = 100 \text{ fb}^{-1}$

$$\tilde{\chi}_2^0 \tilde{\chi}_2^0$$

- ✦ The discovery region for  $A/H \rightarrow \tilde{\chi}_2^0 \tilde{\chi}_2^0 \rightarrow 4 \ell + E_T^{\text{miss}}$  can be accessible only after  $L=300 \text{ fb}^{-1}$ .
- ✦ No clear discovery possibility at lower luminosity
- ✦ The background are mainly **ZZ** and **slepton pair** and **tt pair**.

➤ Discovery accessible also with  $L=100\text{fb}^{-1}$ .

The remaining background are mainly  $ZZ$  and  $tt$  pair, direct  $\chi\chi$ ,  $tH^\pm$  production is not negligible

# Charged Higgs involvement

Analogue production mechanism for  $H^\pm$

Analogue decay mode:

$$H^\pm \rightarrow \chi_{2,3}^0 \chi_{1,2}^\pm \rightarrow 3l + E_T^{miss}$$

Final state: Only 3 lepton

+another lepton from a top decay

➤ The range of discovery is enlarged, extending the search to all MSSM Higgs( $H/A/H^\pm$ ) respect to neutral  $H/A$ , a discovery can be reached also with  $L=100\text{fb}^{-1}$

- ✦ Atlas is preparing for first collision data.
- ✦ The search for MSSM Higgs can full exploit the design of ATLAS experiment: excellent tracking , EM calorimeter ,  $\mu$ -spectrometer resolution, Missing energy reconstruction and b and  $\tau$  tagging capabilities.
- ✦ Discovery potential of MSSM Higgs boson has been estimated by ATLAS .
- ✦ A early discovery of a neutral MSSM boson in some channels (e.g.  $bb h/A \rightarrow \mu\mu, \tau\tau$  ) looks possible with integrated luminosity  $=10 \text{ fb}^{-1}$  , i.e. after only 1-2 year of data taking.
- ✦ First data has the possibility to exclude/or confirm the entire MSSM
- ✦ Others decay channel (as  $\chi_{2,3,4}^0 \chi_{2,3,4}^0$ ) can be explored later for unexplored region of parameter plane and first results can be achieved with  $L =100 \text{ fb}^{-1}$ .
