

# In a Nutshell

*Danilo Piparo, PH-SFT*

# These Slides

Are supposed to support our discussion

Are incomplete: they highlight the aspects we believe are relevant for today's discussion

Are not an introductory course about ROOT

- Several sectors, during your visit mainly in contact with the “Research and Computing” sector (RC)
- Divided in three departments: Experimental Physics, Theoretical Physics and Information Technology

# Who are we?

- We are part of the Software Development for Experiments group (EP-SFT)
  - The “software development unit” of CERN’s Experimental Physics department
- We develop several tools, among which the ROOT framework
  - $O(10.000)$  users, widely adopted library in HEP (also used in other sciences and industry)
- We are active also in simulation (passage of particles through matter and complex detectors), future experiments setup, distributed file systems, virtualisation, software packaging and provision, education and teaching.

# A “Quick Tour” Of ROOT

# What can you do with ROOT?

**LHC collision in CMS:  
event display, also done with ROOT!**

# ROOT in a Nutshell

ROOT is a software toolkit which provides building blocks for

- Data processing
- Data analysis
- Data visualisation
- Data storage

**An Open Source Project**

*All contributions are warmly welcome!*

ROOT is written mainly in C++ (C++11 standard)

- Bindings for Python and other languages\* provided

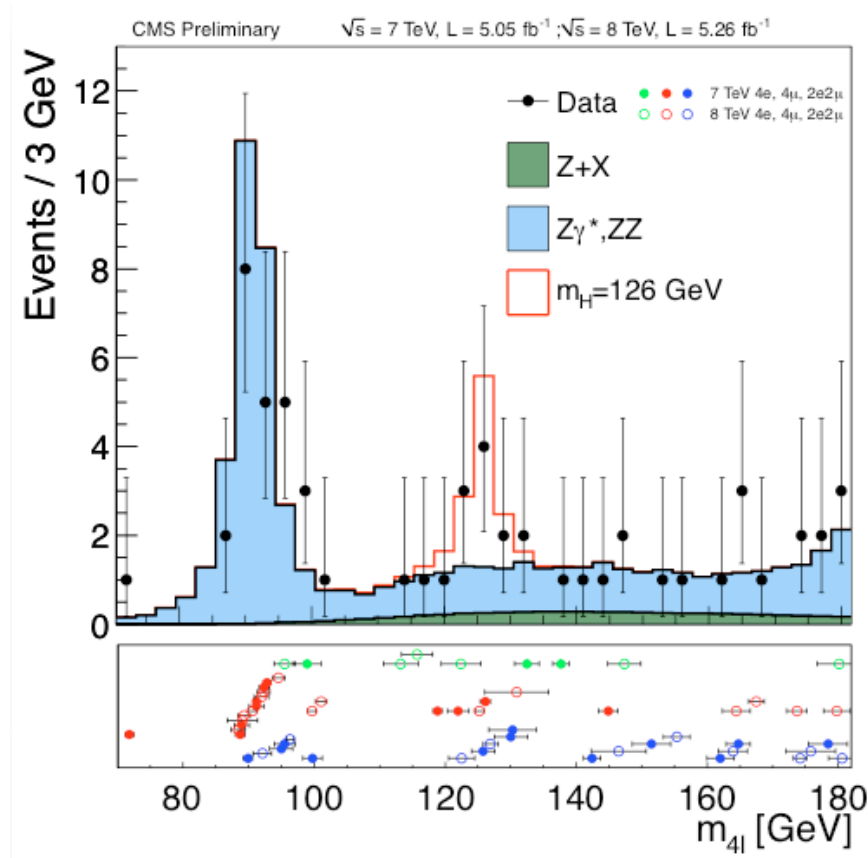

Adopted in High Energy Physics and other sciences (but also industry)

- ~250 PetaBytes of data in ROOT format on the LHC Computing Grid
- Fits and parameters' estimations for discoveries (e.g. the Higgs)
- Thousands of ROOT plots in scientific publications

\* Atm only Python for the 6 series

# Prestigious Discoveries with ROOT

# Guess who is also using it...

# ROOT in a Nutshell

ROOT can be imagined as a family of building blocks for a variety of activities, for example:

- Data analysis: [histograms](#), [graphs](#), [trees](#)
- [I/O](#): row-wise, column-wise storage of **any** C++ object
- Statistical tools ([RooFit/RooStats](#)): rich modeling and statistical inference
- [Math](#): non trivial functions (e.g. Erf, Bessel), optimised math functions ([VDT](#)), linear algebra
- [C++ interpretation](#): fully C++11 (and optionally C++14) compliant
- [Machine Learning](#)(TMVA): e.g. Boosted decision trees, neural networks
- And more: [HTTP servering](#), [JavaScript visualisation](#), advanced [graphics](#) (2D, 3D, event display).
- PROOF: [parallel analysis facility](#)

# ROOT Application Domains

A selection of the experiments adopting ROOT

Event Filtering

Data

Offline Processing

Reconstruction

Further processing, skimming

Analysis

Event Selection, statistical treatment ...

Raw

Reco

...

Analysis Formats

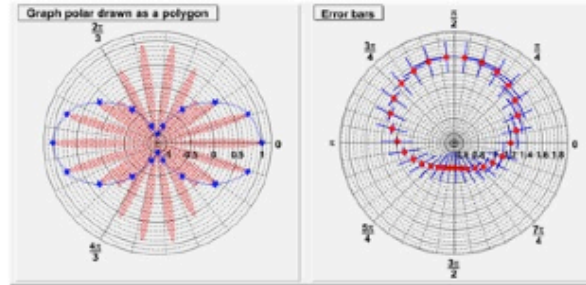

Images

Data Storage: Local, Network

# Graphics In ROOT

Many formats for data analysis, and not only, plots

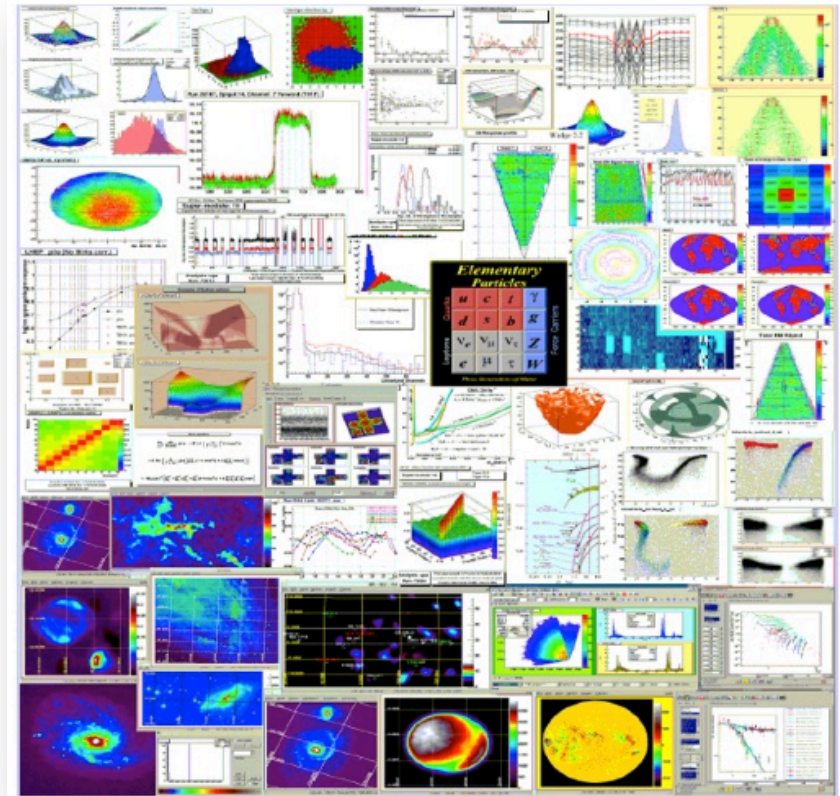

# 2D Graphics

New functionalities added at every new release

Always requests for new style of plots

Can save graphics in many formats: *ps*, *pdf*, *svg*, *jpeg*, *LaTeX*, *png*, *c*, *root*

# 3D Graphics

TH3

TGLParametric

"LEGO"

"SURF"

TF3

# At the Core

ROOT is very modular but there is synergy among its components

**Slim Core** (“orchestration framework”) containing

- Management of **global configuration** settings
- A **type system**: classes, functions, methods, enumerators known to ROOT (highly non C++ standard!)
- **Plugin registration** mechanism: no need to load all libraries at start-up (link), just if needed, at runtime
- Seamless interaction with interpreter functionalities

# Interpreter

ROOT is shipped with an interpreter, CLING

- **C++ interpretation:** highly non trivial and not foreseen by the language!
- One of its kind: Just In Time (JIT) compilation
- A C++ interactive shell.

Can interpret “macros” (non compiled programs)

- Rapid prototyping possible

```
$ root -b
root [0] 3 * 3
(const int)9
```

ROOT provides also **Python bindings**:

- Can use Python interpreter directly after a simple *import ROOT*
- Possible to “mix” the two languages (see more in the following slides!)

# Interpreter: interactive shell

~> root

```
~-> root
root [0] i = 4
(int) 4
root [1] TH1F h("myHisto","Histogram Title",64,-4,4)
(TH1F &) Name: myHisto Title: Histogram Title NbinsX: 64
root [2] h.FillRandom("gaus")
root [3] h.GetSkewness()
(Double_t) 0.00699916
...
```

# And Python too...

```
python
```

```
Python 2.7.6 (default, Sep 9 2014, 15:04:36)
```

```
[GCC 4.2.1 Compatible Apple LLVM 6.0 (clang-600.0.39)] on darwin
```

```
Type "help", "copyright", "credits" or "license" for more information.
```

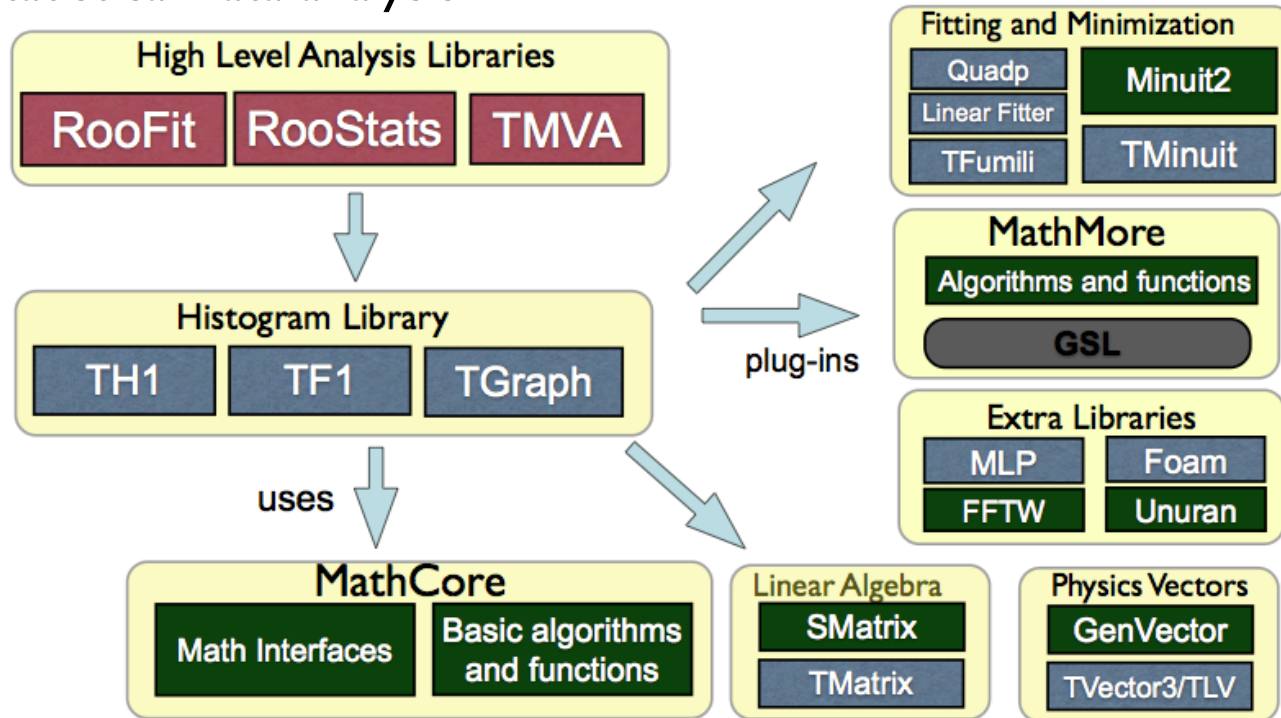

```
>>> import ROOT
```

```
>>> h = ROOT.TH1F("h","h",64,-4,4)
```

```
>>> h.Draw()
```

# ROOT Math/Stats Libraries

ROOT provides a reach set of mathematical libraries and tools needed for sophisticated statistical data analysis

# Persistence (I/O)

ROOT offers the possibility to write C++ objects into files

- **Exceptional:** impossible with C++ alone!
- Used for tens of **petabytes/year** rates of **LHC** detectors.
- Of course simple, **flat n-tuples are supported** (in fact, complex objects are automatically decomposed in simple columns)

Achieved with serialization of the objects using the reflection capabilities, ultimately provided by the interpreter

- Raw and column-wise streaming

Cornerstone for storage  
of experimental data

As simple as this for ROOT objects: one method - `TObject::Write`

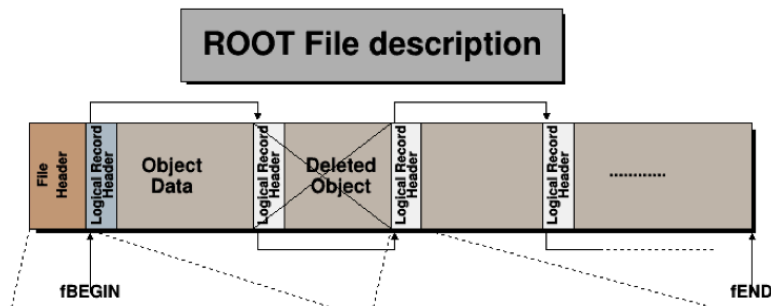

And for non ROOT objects: `myFile.ReadObject(myObjPointer, "objName")`

# The ROOT file Format

The ROOT file format is the format of HEP

- Some sporadic exception in very specialised and controlled environments (e.g. Raw data of LHCb)

This is its complete description.

Byte Range	Record Name	Description
1->4	"root"	Root file identifier
5->8	fVersion	File format version
9->12	fBEGIN	Pointer to first data record
13->16 [13->20]	fEND	Pointer to first free word at the EOF
17->20 [21->28]	fSeekFree	Pointer to FREE data record
21->24 [29->32]	fNbytesFree	Number of bytes in FREE data record
25->28 [33->36]	nfree	Number of free data records
29->32 [37->40]	fNbytesName	Number of bytes in <b>TNamed</b> at creation time
33->33 [41->41]	fUnits	Number of bytes for file pointers
34->37 [42->45]	fCompress	Compression level and algorithm
38->41 [46->53]	fSeekInfo	Pointer to <b>TStreamerInfo</b> record
42->45 [54->57]	fNbytesInfo	Number of bytes in <b>TStreamerInfo</b> record
46->63 [58->75]	fUUID	Universal Unique ID

# Other ROOT Features

## Geometry Toolkit

- Represent geometries as complex as LHC detectors

## Event Display (EVE)

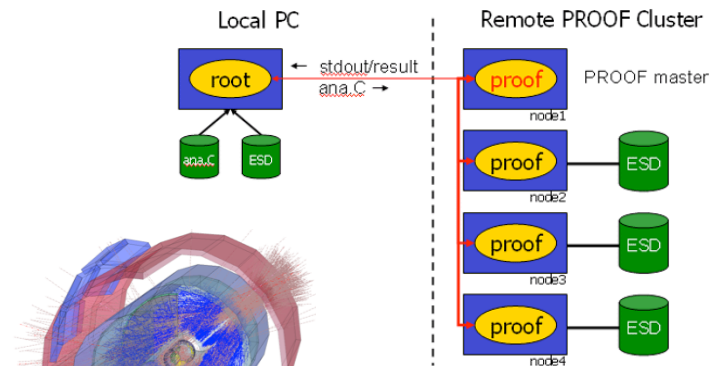

- Visualise particles collisions within detectors

## PROOF: Parallel ROOT Facility

- Multi-process approach to parallelism
- A system to run ROOT queries in parallel on a large number of distributed computers
- Proof-lite: does not need a farm, uses all the cores on a desktop machine

## PROOF Schema

# Jupyter

- Allow physicists to express analyses in form of notebooks
  - Code, plots and explanations in the same document
  - Reproducibility, easy to share
- We want ROOT well integrated with Jupyter notebooks
  - ROOT Kernel (mainly C++)
  - Integration of ROOT Python modules in Python notebooks
- We want to offer “Data Mining as a Service” at CERN
  - Jupyterhub
  - ROOT, R, Python, ...
  - CERN authentication, storage, batch: combine Jupyterhub with the CERN services portfolio (More details tomorrow!)

# Notebooks, Documentation, Education

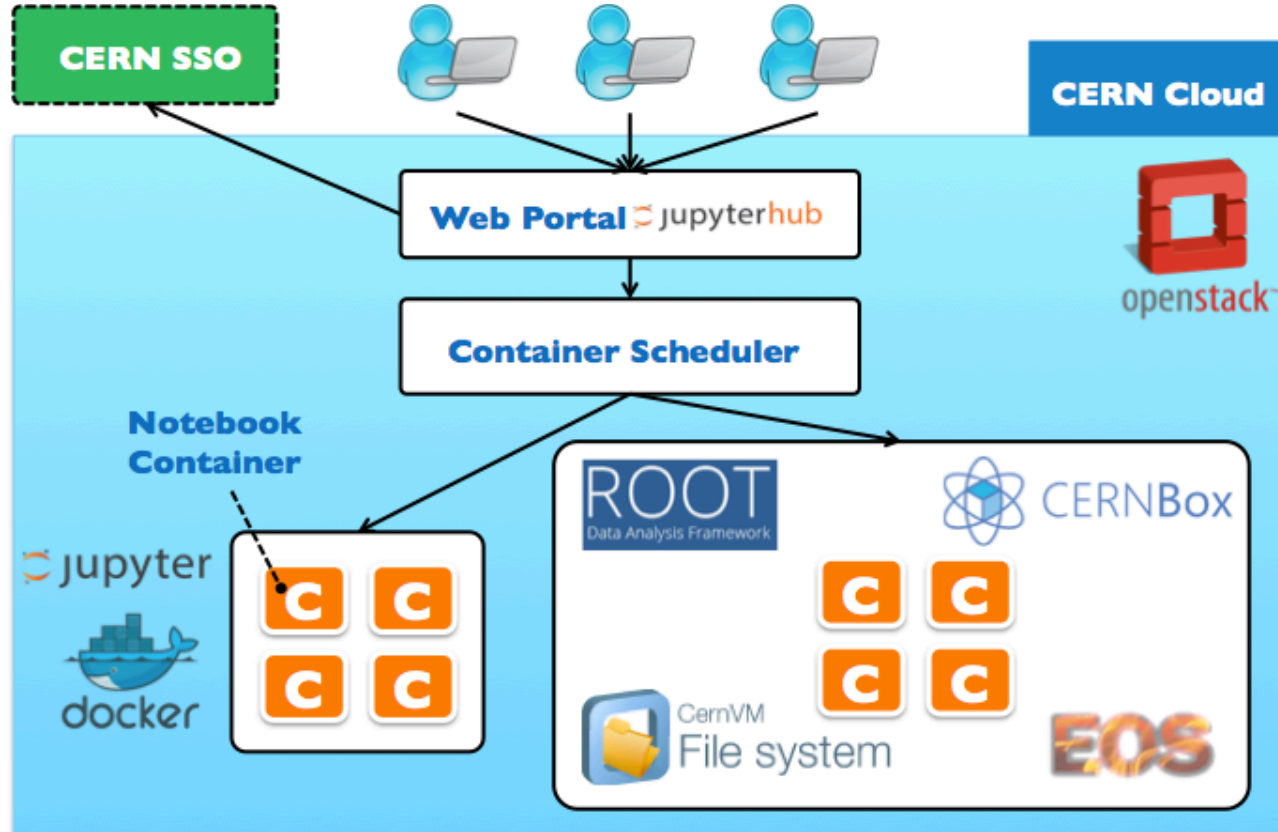

From the ROOT website:

- <https://root.cern.ch/howtos#Jupyter%20Notebooks>
- <https://root.cern.ch/code-examples#rootbooks>

From the ROOT Summer Students' tutorial

- <https://indico.cern.ch/event/395198>
- 50 participants with various technical skills (age 22-25) in this session, a single powerful server, jupyterhub, ROOT  
→ A success!

# Jupyterhub at CERN

# Notebooks on the Agenda and Demo

- Indico: CERN conference management system
- Jupyter notebooks rendering

# BACKUP

# The ROOT Prompt

C++ is a compiled language

- A compiler is used to translate source code into machine instructions

ROOT provides a C++ **interpreter**

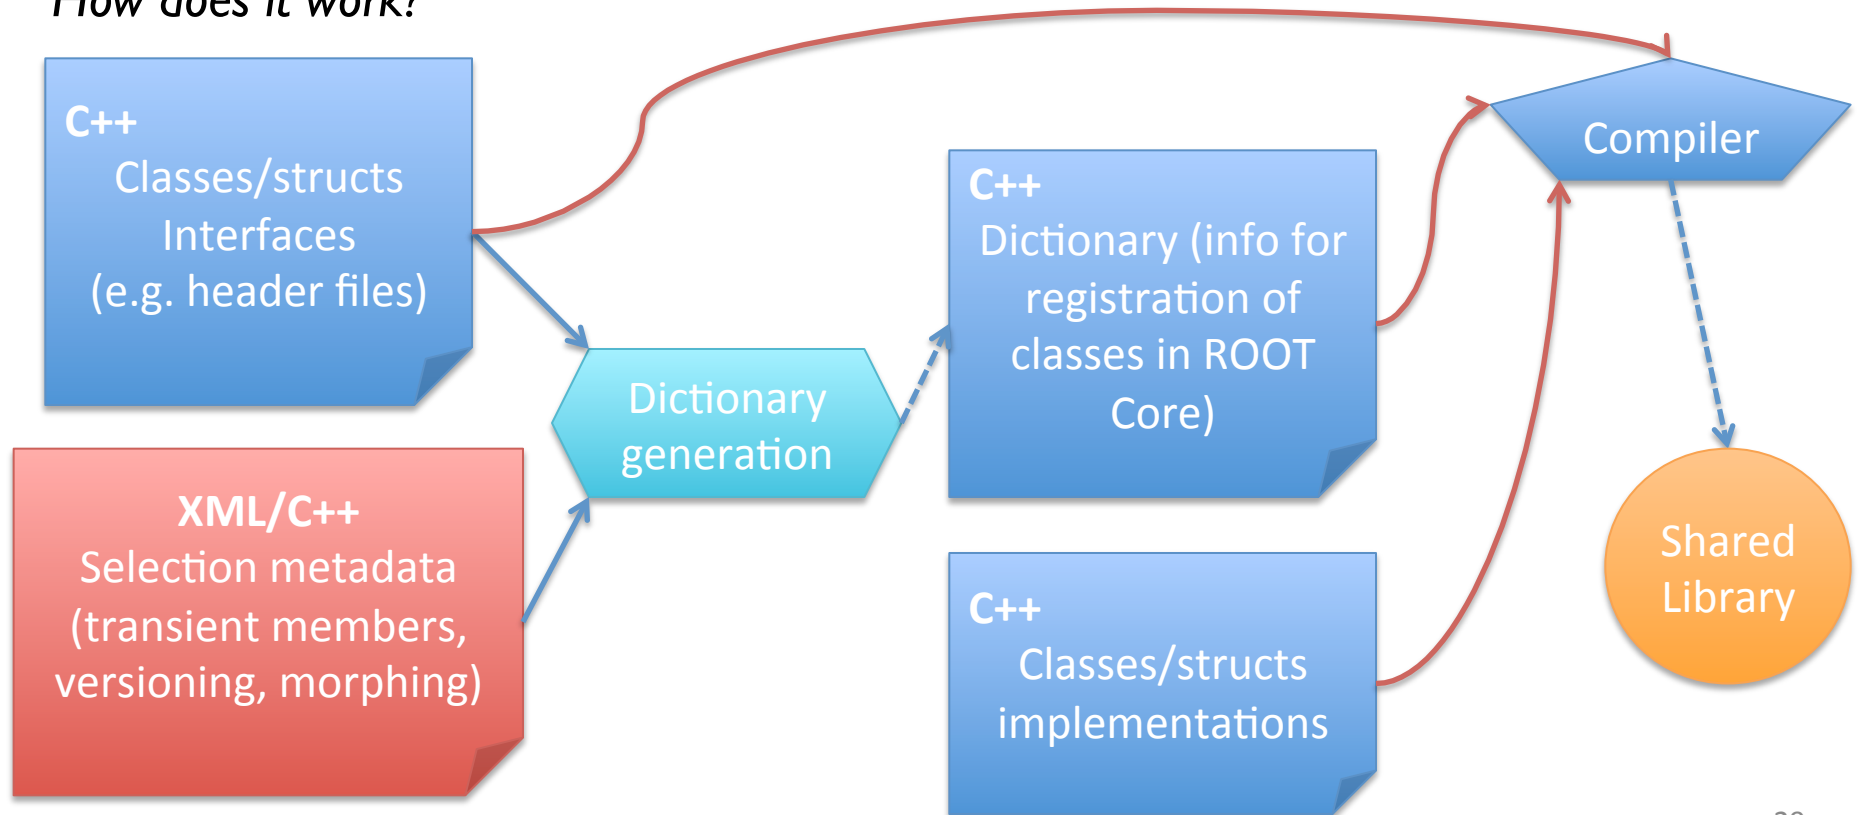

- Interactive C++, w/o the need of a compiler, like Python, Ruby, Haskell ...
- Allows reflection (inspect at runtime layout of classes)
- Can be booted with the command:

**root**

- The interactive shell is also called “ROOT prompt” or “ROOT interactive prompt”

# Persistency (I/O)

*How does it work?*

# Persistency (I/O)

*How does it work?*

Now ROOT “knows” how to serialise the instances implemented in the library (series of data members, type, transiency) and to write them on disk in row or column format.

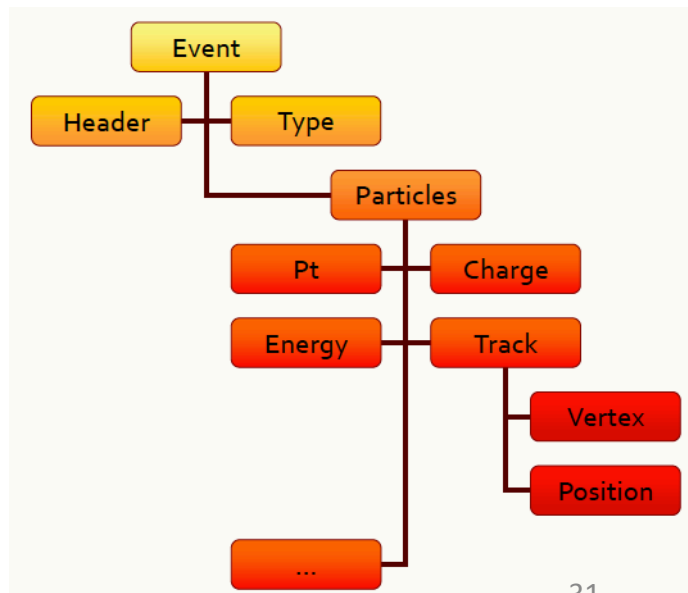

# Trees

- The TTree is the data structure ROOT provides to store large quantities of same types objects
- Organised in branches, each one holding objects: partial reads possible
- Organised in independent events, e.g. collision events
- Efficient disk space usage, optimised I/O runtime

LEP style flat n-tuples  
evolved in more efficient  
trees (fast access, read  
ahead)

# Preemptive Trouble Shooting

? *What could be the advantage of learning this software technology?*

! **1.** Batteries included: you have all the tools to process, store, analyse and visualise data in one single kit.

! **2.** You join a huge community,  $O(10^4)$  users + a very supportive team of core developers

? *Why C++ and not a scripting language?!*

! Performance. Support for languages like Python

? *Why prompt and libraries instead of a GUI?*

! ROOT is a programming framework, not an office suite.

# Trees

Does it scale? Yes – it does

- Files can be as big as a few gigabytes (10? 20?)
- LHC experiments write and read ROOT files
- 250PB of data registered on the WLCG in ROOT format: much more around (university clusters, private ntuples, non LHC experiments!)

From Ian's presentation:

- A full genome: 200GB
- Genes (5%): 10GB
- A “study group”: 100 individuals

From Nature:

- 4 Nucleobases
- Homo Sapiens: 3 billion bases / genome
- Homo Sapiens: 25k Genes

# The ROOT file Format

Provided and desirable features

- Simple: “keys” on disk, easily described and open source
- Demonstrated reliability: easy recovery, self describing (description of data stored with the data)
- Efficient: compressed data, options available for compression algorithms
- Remote reading over the network over already available protocols
- Backward/forward compatibility
