

# Data Management

- Storage situation right now overall looks fine.
- Deletion was down last week everywhere for a period of about 3 days to prevent deletion of needed data. By error was not switched back for US sites. Back after our notification.
- Organize monthly dumps at all sites, for each RSE, to run centrally consistency checks. Each site has a dedicated ggus ticket on that.
- Follow up the size dynamics of DAODs at T2s. Some gradual growth of the size. Do we need extra copy of HI DAODs to be replicated to US T2s.
- Reminder to cleanup the remaining 15TB dark data at BNL PRODDISK and reallocate the space (~200TB) to USERDISK.
