Plan

- where we stand in string model building
- local GUTs + minilandscape
- theory motivation for $O(TEV)$ scales

Heterotic String Model Building

(bosonic formulation)

heterotic string	- 1985	Gross, Harvey, Martinec, Rohm
orbifold	- -n-	Dixon, Harvey, Vafa, Witten
semirealistic models	- 1987 1988	Ibañez, Nilles, Quevedo, Kim Casas, Muñoz Ross et al.
	• • •	
orbifold GUTs in heterotic models	- 2004	Kobayashi, Raby, Zhang Förste, Nilles, Vaudrevange, Wingerter
MSSM	- 2005	Buchmüller, Hamaguchi, O.L., Ratz
MSSM on CY	- -n-	Braun, He, Ovrut, Pantev Bouchard, Donagi
100 MSSMs	- 2006	{O.L., Nilles, Raby, Ramos-Sánchez, Ratz, Vaudrevange, Wingerter}
	↓	Also models by Kim, Kyae '06

Free fermionic constructions :

Cleaver, Faraggi, Nanopoulos '98

Basics

Heterotic string = 10 D superstring +
26 D bosonic

Gauge symmetry :

$$E_8 \times E_8$$

(or $SO(32)$)

Compactification : orbifold

$$T_2 \otimes T_2 \otimes T_2 / \mathbb{Z}_N$$

A model is specified by :

- twist $\theta = \left(\frac{-1}{2}, \frac{1}{3}, \frac{1}{6}\right), \dots$

- lattice

- gauge shift V

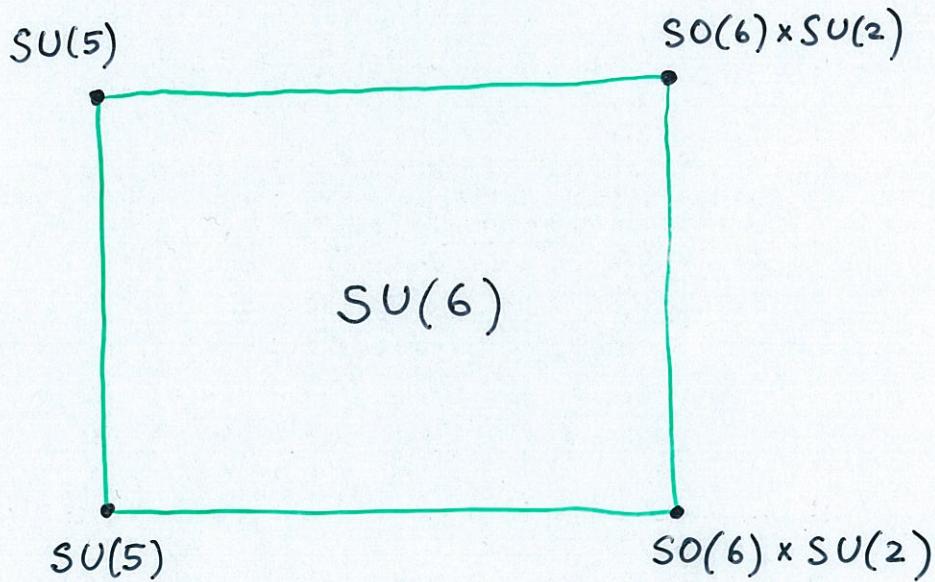

- Wilson lines W_i

Orbifold GUT limits

Kobayashi, Raby, Zhang
2004

Förste, Nilles, Vaudrevange,
Wingerter '2004

$$r_1 \gg r_2, r_3$$

4D gauge group = intersection

fixed points ~ "branes"

Local GUT strategy

Buchmüller, Hamaguchi,
O.L., Ratz, 2005

① Choose gauge shift:

16-plet of $SO(10)$ $\in T_1$

Reason: massless states from T_1
are automatically twist-invariant
 \Rightarrow complete 16-plets at low energies

② Choose Wilson lines:

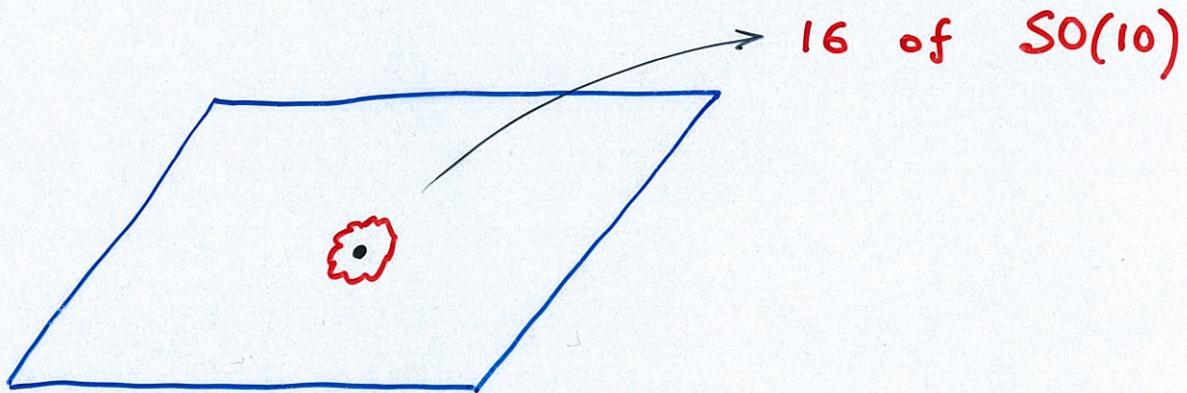

4 D gauge group = SM $\times \dots$

Remark: does not destroy ①

③ Choose Wilson lines:

$SM \subset SU(5) \rightarrow GUT \quad U(1)_Y$

Reason: standard hypercharge
normalization \Rightarrow
gauge coupling unification

No 4D GUT, but

- complete 16-plets
- gauge coupl. unification

Bulk states partially projected out \Rightarrow

- gauge group = SM
- split Higgses

Statistics

O.L., Nilles, Raby, Ramos-Sánchez,
Ratz, Vandervenage, Wingerter
2006

	$V_{SO(10)}^1$	$V_{SO(10)}^2$	$V_{E_6}^1$	$V_{E_6}^2$
inequiv. models with 2 WL	10^4	10^4	10^3	10^3
SM gauge group $\subset SU(5) \subset SO(10)$	3563	1163	27	63
3 net (3, 2)	1170	492	3	32
non-anomal. $U^{(1)}_Y \subset SU(5)$	528	234	3	22
spectrum = 3 gener. + vector-like	128	90	3	2
heavy top	72	37	3	2
exotics decouple + gauginos condense	47	25	3	2
B-L ...				

$10^2 / 10^4$ are good!

→ "Fertile patch" of the Landscape

Hidden - Observable sector correlations and SUSY

Phenomenology favours TeV SUSY
masses :

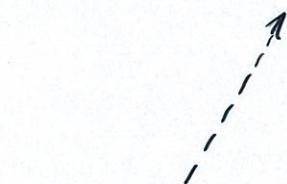

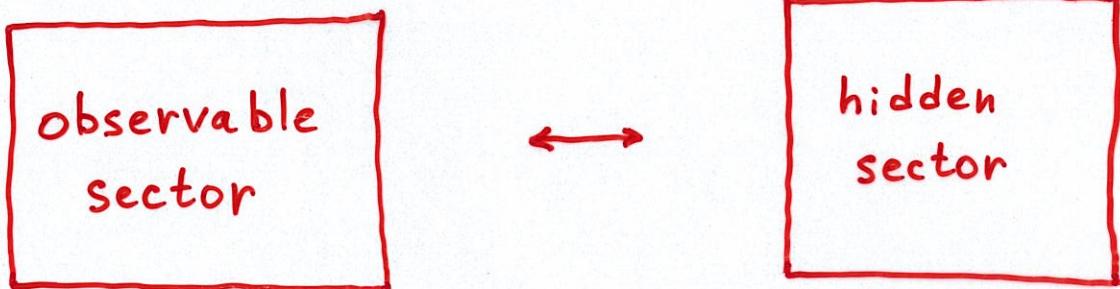

- gauge coupling unification
- EW symmetry breaking
- hierarchy problem
- ...

What is special about the TeV scale?

(from the top-down perspective)

TeV soft masses are as good as
eV or 10^6 TeV
soft masses

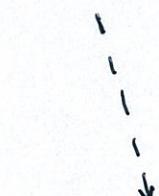

... OR ARE THEY?

require:

3 generations,
no exotics,
 $Y_t \sim 1$,
...

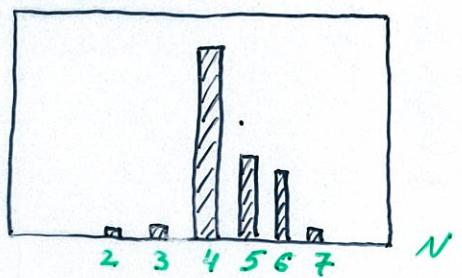

(see also Dienes '06, '07)

preferred:

pure SYM
 $SO(8)$, $SU(5)$, ...

of
models

for $SU(N)$, $SO(2N)$, E_N

The correlations are due to:

- modular invariance
- masslessness condition (twisted)
- GSO (twisted)

If SUSY is broken by gaugino condensation,

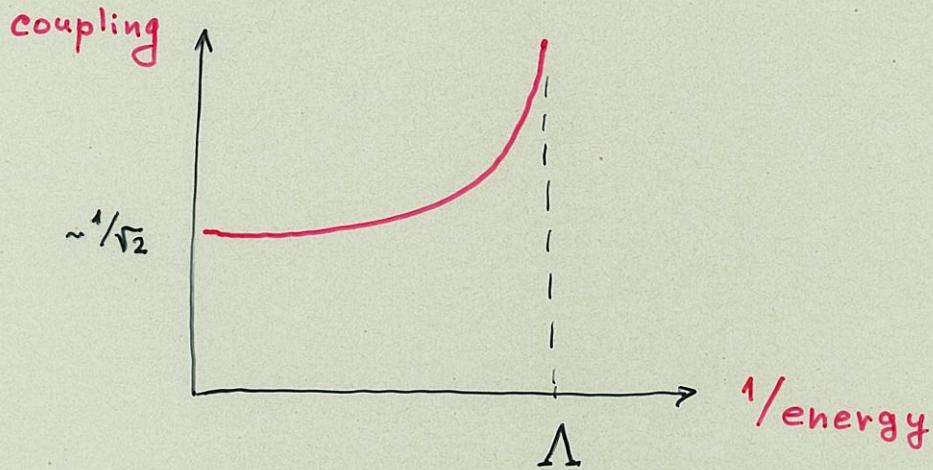

\Rightarrow "prediction" for SUSY masses!

Gaugino condensation

Nilles '82

Ferrara, Girardello,
Nilles '83

Dine et al. '85

$$\Lambda = M_{\text{GUT}} e^{-\frac{1}{2\beta} \cdot \frac{1}{g^2(M_{\text{GUT}})}}$$

$$\langle \lambda \lambda \rangle \sim \Lambda^3 \sim \langle W \rangle$$

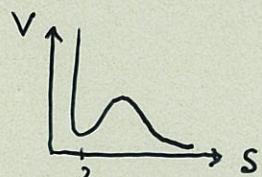

$$m_{3/2} \sim \Lambda^3 / M_{\text{Pl}}^2$$

model-independent!

Example :

$$\begin{cases} W = d \cdot e^{-3S/2\beta} \\ K = -\ln(S + \bar{S}) + \Delta K_{np} \end{cases}$$

$$F_S \sim \frac{\langle \lambda \lambda \rangle}{M_{\text{Pl}}} \quad (F_T = 0)$$

Binetruy, Gaillard,
Wu '96

Casas '96

Gaillard, Nelson '07

Statistics of gaugino condensation

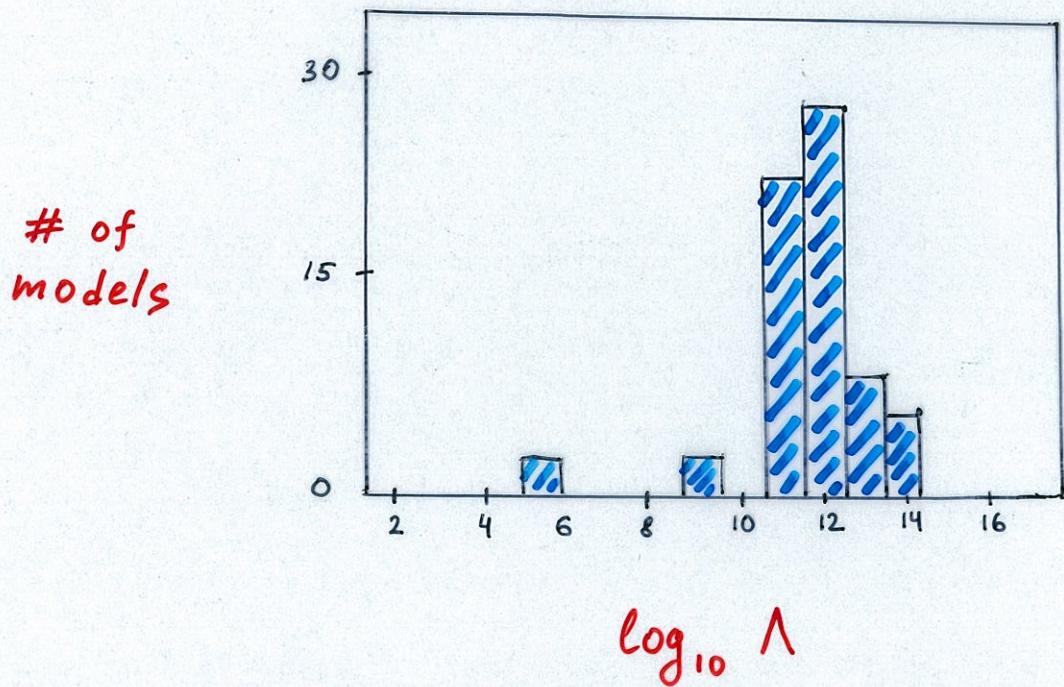

$$\Lambda = M_{\text{GUT}} e^{-\text{const}/\beta}$$

$$\Lambda^3 \sim \langle \lambda \lambda \rangle$$

$$m_{3/2} \sim \Lambda^3 / M_{\text{Pl}}^2$$

(Nilles, ...)

O.L., Nilles, Raby, Ramos-Sánchez,
Ratz, Vandrevange, Wingert,
2006

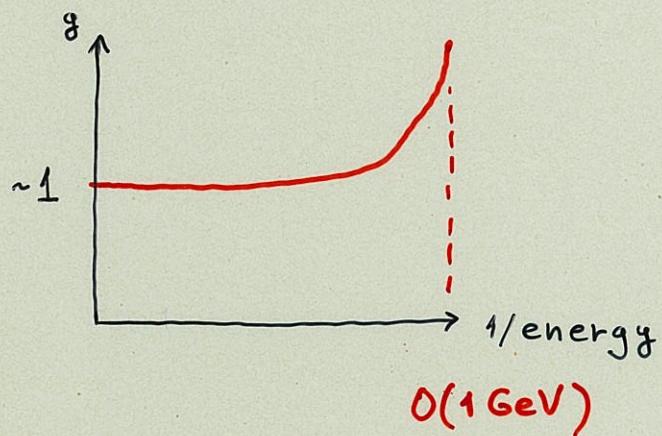

intermediate scale $\Lambda \sim 10^{12} \text{ GeV}$
is preferred !

\Rightarrow theory motivation for TeV soft masses

Resulting picture:

Observable sector :

$O(1 \text{ GeV})$

(\Rightarrow nucleon / atom masses
 $\sim \text{GeV}$)

hidden
sector :

$O(10^{12} - 10^{13} \text{ GeV})$

\Rightarrow

$$EW \sim \frac{\Lambda^3}{M_{Pl}^2}$$

Conclusion

- progress in the last 2 years
- 100 MSSM's
- THEORY motivation for
TeV soft masses / EW scale
