

The background features several large, overlapping, semi-transparent swirls in shades of purple, green, and blue. Interspersed among these swirls are numerous small, yellow, triangular shapes pointing in various directions, creating a dynamic and energetic visual effect.

# **SUSY Studies with ATLAS**

Iris Borjanovic

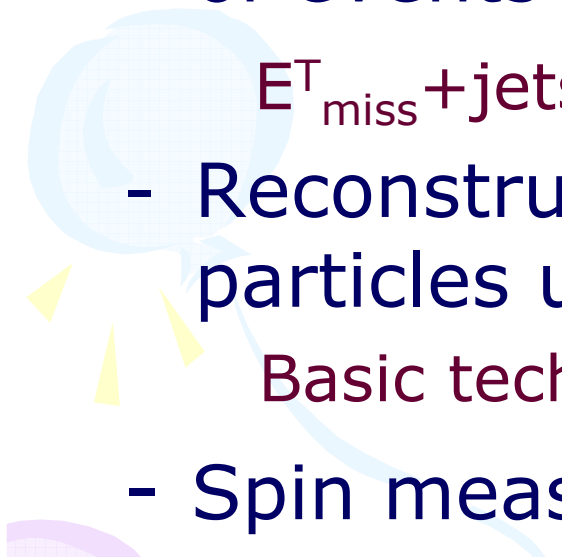

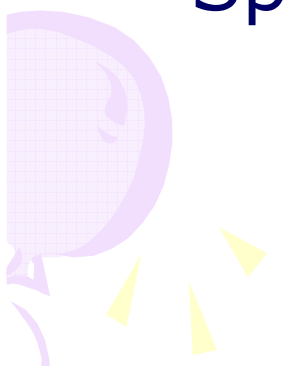

University of Lecce

On behalf of the ATLAS collaboration

**2006 LHC days in Split**

# Outline

- Introduction
  - Search for a generic SUSY signal (excess of events over SM contribution)
    - $E_{\text{miss}}^T$ +jets search, background
  - Reconstruction of the mass of SUSY particles using selected decays
    - Basic techniques, some full simulation results
  - Spin measurements
- 
- 

# SUSY

SUSY at TeV mass scale most attractive extension of Standard Model. Provides **naturally light Higgs, grand unification, and cold dark matter**

For each Standard Model particle  $X$ , MSSM has partner  $\tilde{X}$  with  $\Delta J = \pm 1/2$ :

**Each gauge boson  $\Leftrightarrow$**

**Massless spin-1/2 gaugino**

- gluino
- photino, wino, zino (mix with higgsinos  $\Rightarrow$  neutralinos, charginos)

**Each chiral fermion  $\Leftrightarrow$  Massless spin-0 sfermion**

- squark (stop, sbottom)
- slepton (selectron, smuon)

**Also two Higgs doublets and corresponding**

**$J=1/2$  Higgsinos**

**Inexact symmetry – broken somehow**

# R-parity

$$R = (-1)^{3B-3L+2S}$$

$$= + 1 \text{ ( SM particles )}$$

$$= - 1 \text{ ( SUSY particles )}$$

Two main SUSY scenarios:

- R-parity conservation (RPC) or R-parity violation (RPV)

## **RPC implies:**

- No proton decay
- SUSY particles produced in pairs and decay to stable Lightest SUSY Particle (LSP), usually  $\tilde{\chi}_1^0$  which is stable, neutral and weakly interacting so escapes detector => large missing energy.
- WMAP results indicate cold dark matter. LSP is good candidate for cold dark matter

Would like to break SUSY dynamically. Not possible just with MSSM; must communicate breaking in hidden sector via some interactions

·  
**Many LHC studies use mSUGRA model.**

Has simplest gravity mediated breaking with just 4 parameters:

- Common scalar mass  $\mathbf{m_0}$  at GUT scale;
  - Common gaugino mass  $\mathbf{m_{1/2}}$  at GUT scale;
  - Common trilinear coupling parameter  $\mathbf{A_0}$ ;
  - Common ratio  $\mathbf{\tan(\beta)}$  of Higgs VEV's at weak scale.
- Also sign  $\mathbf{\text{sgn}(\mu)=\pm 1}$  of Higgs mass

Must solve RGEs' to connect GUT and weak scale masses

# ATLAS activities in SUSY

**Supersymmetry physics one of the priorities of on-going ATLAS studies**

**In the past** (ATLAS Physics TDR 1998)

- Fast simulation studies (parametrized detector response), focus on discovery potential, reconstruction of s-particle masses for a few selected benchmarks

**Now**

- Full simulation studies (preliminary)
- Detector commissioning and systematic
- Background estimation (use/validate latest MC, techniques to measure background from data)
- New models and measurement techniques

**Huge variety of models being studied.**

**In this talk: mSUGRA**

# SPS1a point

A particularly extensive study is available for **SPS1a** point (**fast simulation**), **favourable at LHC** – it will be used here to illustrate techniques to reconstruct the squark mass spectrum

$m_0 = 100$  GeV,  $m_{1/2} = 250$  GeV,  $A_0 = -100$  GeV,  $\tan(\beta) = 10$ ,  $\mu > 0$

Moderately heavy gluinos and squarks

Heavy and light gauginos

Higgs at the limit of LEP reach

light sleptons

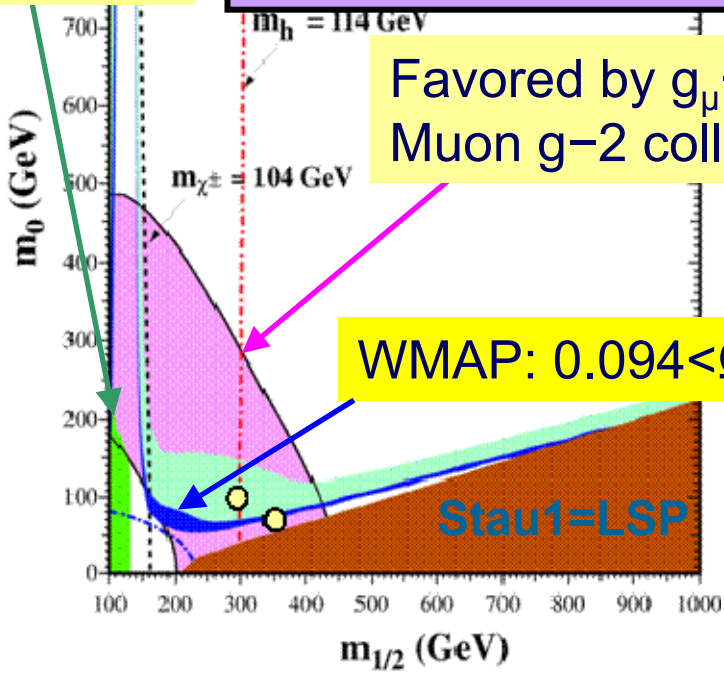

Coannihilation	70	350	0	10	+
Focus point	3550	300	0	10	+
Bulk	100	300	-300	6	+

Full detailed GEANT4 based simulation studies, when available will be also shown, for few recently selected set of benchmark points, in agreement with all the latest experimental and theoretical constraints [Ellis.] Goals: test software for data reconstruction and analysis, computing grid production. Study detector-related systematic. Validate fast simulation results.

Excluded by  $b \rightarrow s\gamma$  (CLEO, BELLE)  $\rightarrow$

Favored by  $g_\mu - 2$  at the  $2\sigma$  level  
Muon  $g-2$  coll.

WMAP:  $0.094 < \Omega_\chi h^2 < 0.129$

$\tan\beta = 10, > 0, A_0 = 0$

The background features several large, overlapping, semi-transparent swirls in shades of purple, green, and blue. Interspersed among these swirls are numerous small, yellow, starburst-like shapes, some of which are larger and more prominent than others. The overall effect is a vibrant, celebratory, and dynamic composition.

**SUSY discovery  
potential**

# mSUGRA events topology

Strongly interacting sparticles (squarks, gluinos) dominate LHC production. Cascade decays to the stable  $\tilde{\chi}^0_1$

## Event topology:

- High  $p_T$  jets (from squark/gluino decay)
- Large  $E_T^{\text{miss}}$  signature (from LSP)
- High  $p_T$  leptons, b-jets, t-jets  
(depending on model parameters)

Best strategy for mSUGRA is usually :  
 **$E_T^{\text{miss}}$  + jets + n-leptons**

# Missing transverse energy

Missing  $E_T$  has an excellent discrimination power of signal from SM background

## Standard SUSY cuts

- $E_{T\text{miss}} > 100$  GeV
- $p_{T\text{1st}} > 100$  GeV,  $p_{T\text{4th}} > 50$  GeV
- Transverse sphericity  $> 0.2$

Better signal significance can be achieved by optimising missing  $E_T$  cut, depending on the SUSY mass scale

Background: ALPGEN

# Effective mass

Jets +  $E_T^{\text{miss}}$  events

$$M_{\text{eff}} = E_T^{\text{miss}} + \sum p_T^{\text{jets}}$$

## Selection cuts:

$$E_T^{\text{miss}} > \min(100 \text{ GeV}, 0.2 M_{\text{eff}})$$

$$p_T(j_1, j_2, j_3, j_4) > 100, 100, 50, 50 \text{ GeV}$$

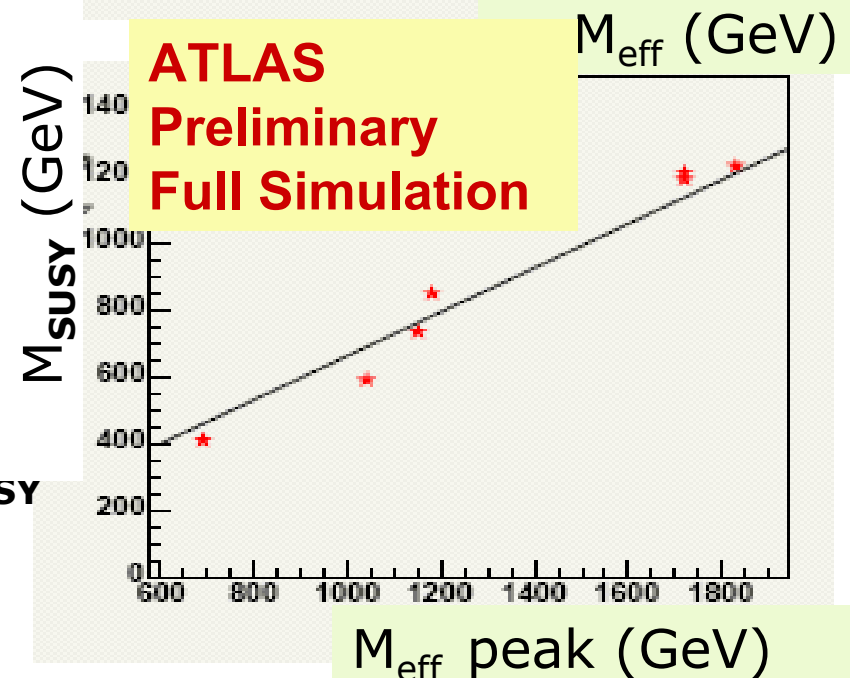

No leptons

The peak of the distribution of the effective mass: if visible above the background, is strongly correlated with the mass of the SUSY particle produced (squark/gluino):

$$M_{\text{SUSY}} = \min(M(\tilde{q}), M(\tilde{g})), M_{\text{eff}} \approx 2M_{\text{SUSY}}$$

First estimate of SUSY mass scale

[Tovey].

# Background to SUSY searches

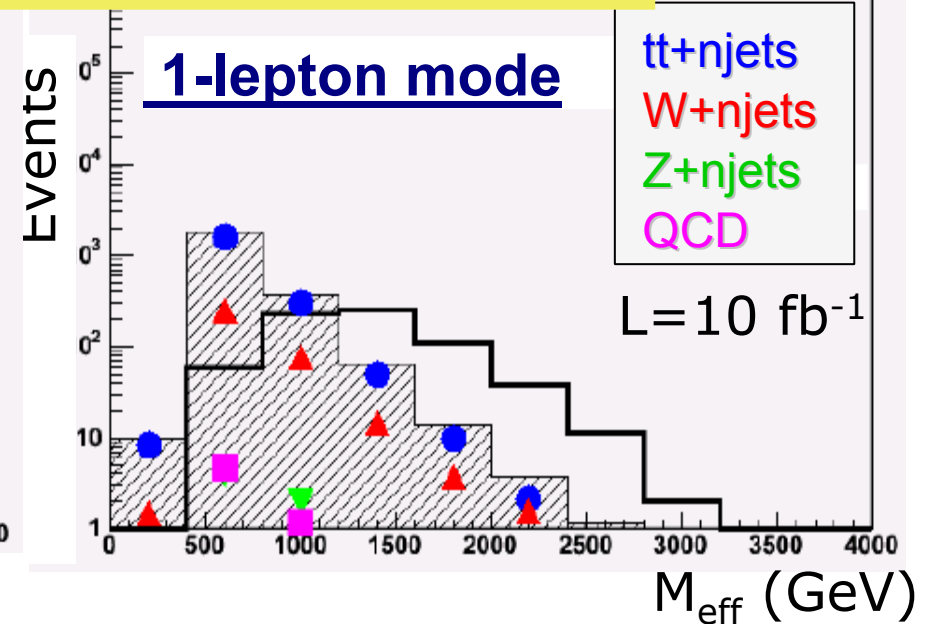

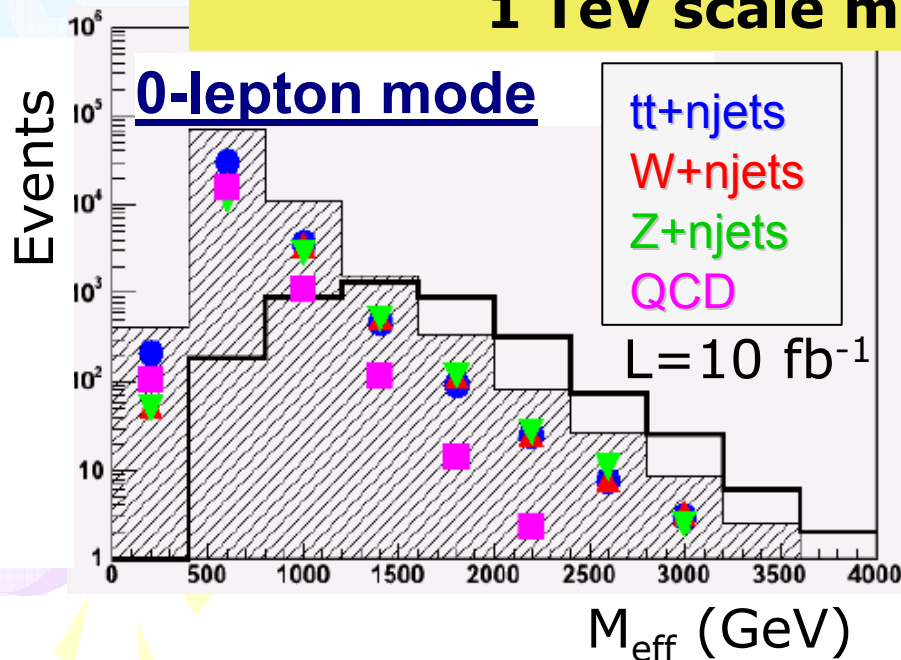

ATLAS Preliminary  
Fast Simulation

- Recent (2005) study with AlpGen + Pythia (MLM match)
- Background increases

**Discovery of 1 TeV SUSY still easy if systematic smaller than statistical errors**

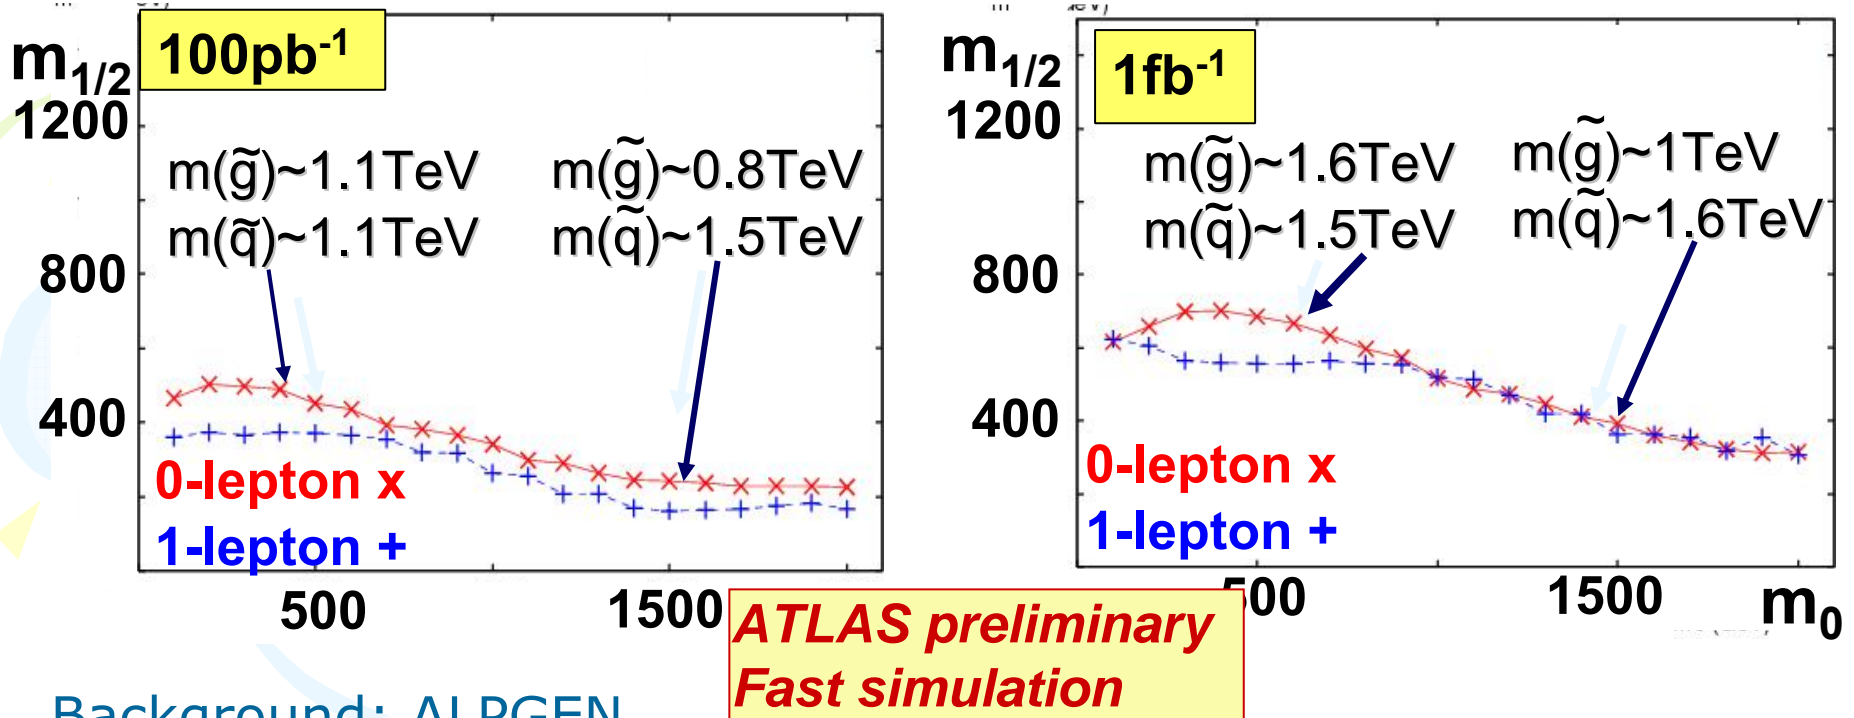

$$E_{\text{T miss}} > \max(100\text{GeV}, 0.2M_{\text{eff}}), \quad p_{\text{T}}(j1,j4) > 100, 50 \text{ GeV}, \quad S_{\text{T}} > 0.2$$

## 1 TeV scale mSUGRA model

# Discovery potential

5- $\sigma$  discovery potential on  $m_0$ - $m_{1/2}$  plane ( $\tan\beta=10, >0, A_0=0$ )  
 After scan of  $m_0$ - $m_{1/2}$  plane and optimisation of cuts for each point

**The discovery potential for the early data:**

$M_{\text{SUSY}} < 1.1 \text{ TeV}$  at  $L = 100 \text{ pb}^{-1}$  (after one week)

$M_{\text{SUSY}} < 1.5 \text{ TeV}$  at  $L = 1 \text{ fb}^{-1}$  (after one month)

# **Mass measurements**

# s-Transverse Mass

$$\tilde{q}_R \tilde{q}_R \rightarrow q \bar{q} \tilde{\chi}_1^0 \tilde{\chi}_1^0$$

$$E_{T \text{ miss}} > 400 \text{ GeV}$$

$$2 \text{ jets with } p_T > 200 \text{ GeV}$$

$$\Delta R(j_1, j_2) > 1$$

Partition in all possible ways

$$\vec{E}_T = \vec{E}_{T1} + \vec{E}_{T2} \text{ and calculate } M_{T2} \text{ [Allanach]}$$

$$M_{T2}^2 = \min_{\vec{E}_{T1}, \vec{E}_{T2}} [ \max \{ m_T^2(p_{T,j1}, \vec{E}_{T1}, M(\tilde{\chi}_1^0)), m_T^2(p_{T,j2}, \vec{E}_{T2}, M(\tilde{\chi}_1^0)) \} ]$$

ATLAS preliminary  
full simulation  
stau coannihilation point

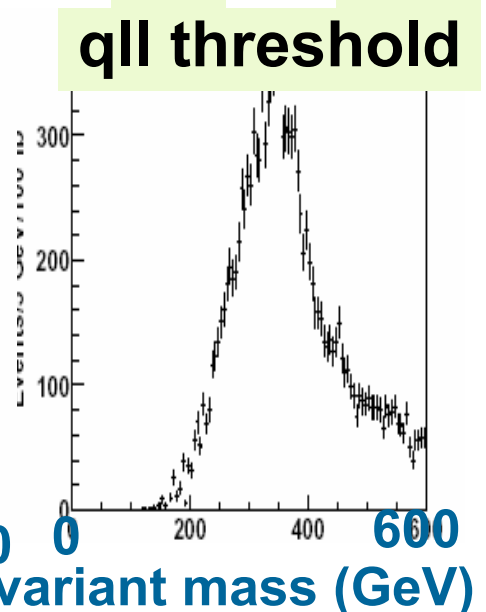

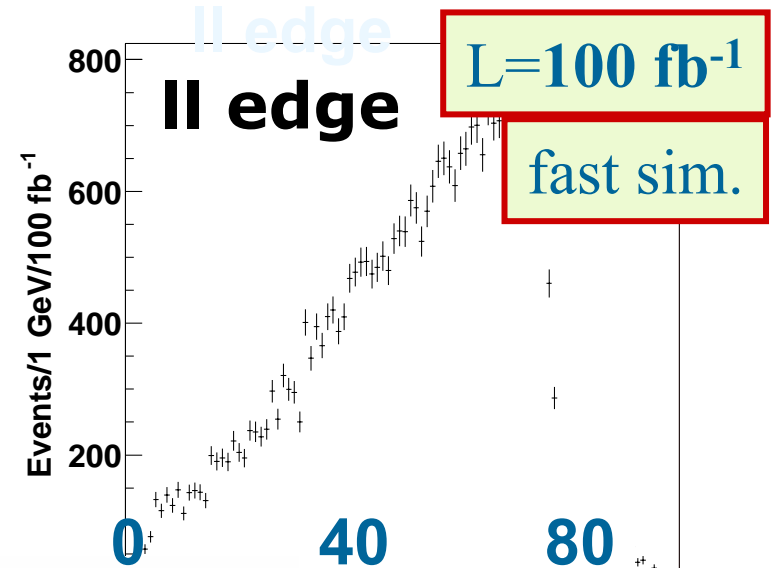

# Left squark cascade decay

$$\tilde{q}_L \rightarrow \tilde{\chi}_2^0 q \rightarrow \tilde{l}_R l q \rightarrow llq \tilde{\chi}_1^0$$

**SPS1a**

2 SFOS lep.,  $p_T > 20, 10$  GeV  
 $\geq 4$  jets,  $p_T > 150, 100, 50, 50$  GeV  
 $M_{\text{eff}} > 600$  GeV,  $E_{\text{Tmiss}} > \max(100, 0.2 M_{\text{eff}})$

**[Osland]**

# Endpoint formulas

Related edge	Kinematic endpoint
$l+l^-$ edge	$(m_{ll}^{\max})^2 = (\tilde{\xi} - \tilde{l})(\tilde{l} - \tilde{\chi})/\tilde{l}$
$l+l^-q$ edge	$(m_{llq}^{\max})^2 = \begin{cases} \max \left[ \frac{(\tilde{q}-\tilde{\xi})(\tilde{\xi}-\tilde{\chi})}{\tilde{\xi}}, \frac{(\tilde{q}-\tilde{l})(\tilde{l}-\tilde{\chi})}{\tilde{l}}, \frac{(\tilde{q}-\tilde{\xi})(\tilde{\xi}-\tilde{l})}{\tilde{\xi}} \right] \\ \text{except for the special case in which } \tilde{l}^2 < \tilde{q}\tilde{\chi} < \tilde{\xi}^2 \text{ and} \\ \tilde{\xi}^2\tilde{\chi} < \tilde{q}\tilde{l}^2 \text{ where one must use } (m_{\tilde{q}} - m_{\tilde{\chi}q})^2. \end{cases}$
$Xq$ edge	$(m_{Xq}^{\max})^2 = X + (\tilde{q} - \tilde{\xi}) \left[ \tilde{\xi} + X - \tilde{\chi} + \sqrt{(\tilde{\xi} - X - \tilde{\chi})^2 - 4X\tilde{\chi}} \right] / (2\tilde{\xi})$
$l+l^-q$ threshold	$(m_{llq}^{\min})^2 = \left\{ \begin{array}{l} [ 2\tilde{l}(\tilde{q} - \tilde{\xi})(\tilde{\xi} - \tilde{\chi}) + (\tilde{q} + \tilde{\xi})(\tilde{\xi} - \tilde{l})(\tilde{l} - \tilde{\chi}) \\ - (\tilde{q} - \tilde{\xi})\sqrt{(\tilde{\xi} + \tilde{l})^2(\tilde{l} + \tilde{\chi})^2 - 16\tilde{\xi}\tilde{l}^2\tilde{\chi}} ] / (4\tilde{l}\tilde{\xi}) \end{array} \right.$
$l_{\text{near}q}^{\pm}$ edge	$(m_{l_{\text{near}q}}^{\max})^2 = (\tilde{q} - \tilde{\xi})(\tilde{\xi} - \tilde{l})/\tilde{\xi}$
$l_{\text{far}q}^{\pm}$ edge	$(m_{l_{\text{far}q}}^{\max})^2 = (\tilde{q} - \tilde{\xi})(\tilde{l} - \tilde{\chi})/\tilde{l}$
$l^{\pm}q$ high-edge	$(m_{lq(\text{high})}^{\max})^2 = \max \left[ (m_{l_{\text{near}q}}^{\max})^2, (m_{l_{\text{far}q}}^{\max})^2 \right]$
$l^{\pm}q$ low-edge	$(m_{lq(\text{low})}^{\max})^2 = \min \left[ (m_{l_{\text{near}q}}^{\max})^2, (\tilde{q} - \tilde{\xi})(\tilde{l} - \tilde{\chi})/(2\tilde{l} - \tilde{\chi}) \right]$
$M_{T2}$ edge	$\Delta M = m_l - m_{\tilde{\chi}q}$

**Table 4:** The absolute kinematic endpoints of invariant mass quantities formed from decay chains of the types mentioned in the text for known particle masses. The following shorthand notation has been used:  $\tilde{\chi} = m_{\tilde{\chi}q}^2$ ,  $\tilde{l} = m_l^2$ ,  $\tilde{\xi} = m_{\tilde{\chi}q}^2$ ,  $\tilde{q} = m_{\tilde{q}}^2$  and  $X$  is  $m_h^2$  or  $m_Z^2$  depending on which particle participates in the “branched” decay.

$L=100 \text{ fb}^{-1}$

## Fit results

Edge	Nominal Value	Fit Value	Syst. Error Energy Scale	Statistical Error
$m(ll)^{\text{edge}}$	77.077	77.024	0.08	0.05
$m(qll)^{\text{edge}}$	431.1	431.3	4.3	2.4
$m(ql)^{\text{edge}}_{\text{min}}$	302.1	300.8	3.0	1.5
$m(ql)^{\text{edge}}_{\text{max}}$	380.3	379.4	3.8	1.8
$m(qll)^{\text{thres}}$	203.0	204.6	2.0	2.8

## Mass reconstruction

5 endpoints measurements, 4 unknown masses

$$\chi^2 = \sum \chi_j^2 = \sum \left[ \frac{E_j^{\text{theory}}(\vec{m}) - E_j^{\text{exp}}}{\sigma_j^{\text{exp}}} \right]^2$$

$$E_j^i = E_j^{\text{nom}} + a_j^i \sigma_j^{\text{fit}} + b_j^i \sigma_j^{\text{Escale}}$$

$m(\chi_1^0) = 96 \text{ GeV}$   
 $m(l_R) = 143 \text{ GeV}$   
 $m(\chi_2^0) = 177 \text{ GeV}$   
 $m(q_L) = 540 \text{ GeV}$

$\Delta m(\tilde{\chi}_1^0) = 4.8 \text{ GeV}, \quad \Delta m(\tilde{\chi}_2^0) = 4.7 \text{ GeV},$   
 $\Delta m(\tilde{l}_R) = 4.8 \text{ GeV}, \quad \Delta m(\tilde{q}_L) = 8.7 \text{ GeV}$

[Osland]

# Bulk point

After SM BG cuts + 2 leptons,  
Loose stats but still triangular  
shape visible.

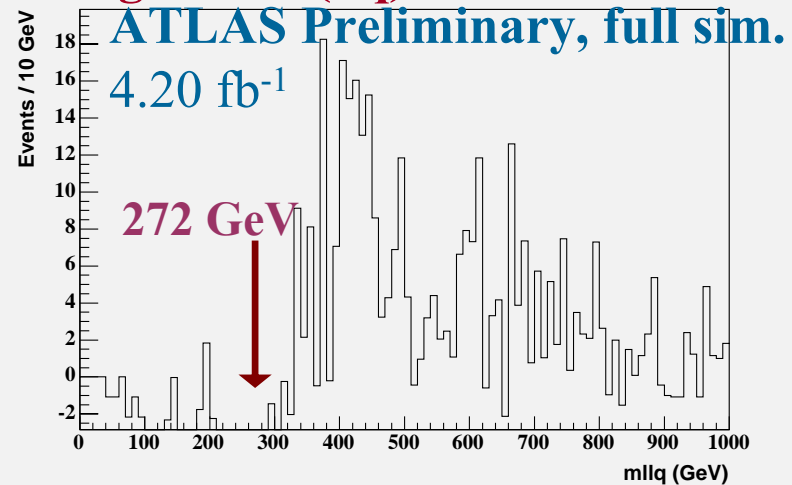

ATLAS Preliminary, full sim.  
4.37 fb<sup>-1</sup>

$(e^+e^-) + \beta^2(\nu) (\mu^+\mu^-) - \beta(\nu) (e^+\mu^-)$

Edge at:  $99.8 \pm 1.2$  GeV (100.17 GeV)

Larger of  $M(lq)$

Smaller of  $M(lq)$

# More complicated case: coannihilation point

Main feature: small mass difference between sleptons and neutralinos, soft leptons in the final state.

$$\tilde{\chi}_2^0 \rightarrow l\tilde{l}_{R,L} \rightarrow ll\tilde{\chi}_1^0$$

Fit by using SFITTER, [Zerwas]

Parameter	Expected precision (300 fb <sup>-1</sup> )
$m_0$	± 1.2%
$m_{1/2}$	± 1.0%
$\tan(\beta)$	± 0.9%
$A_0$	± 20%

sign( $\mu$ ) fixed

Micromegas 1.1 +  
ISASUGRA 7.69

$$\Omega_\chi h^2 = 0.1921 \pm 0.0053$$

[Polesello]

$\Omega_\chi h^2$

# Spin measurement

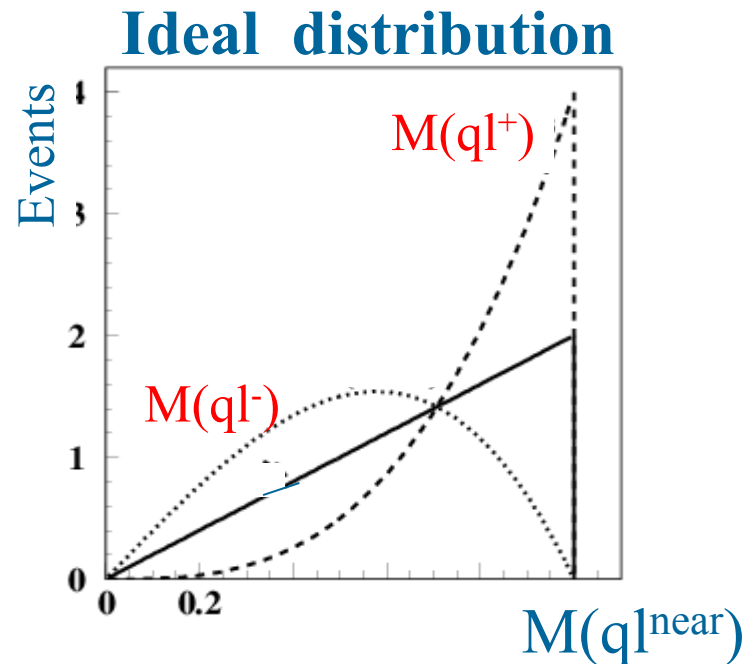

It is vital to measure the spins of the new particles to demonstrate that they are indeed the predicted super-partners

$$\tilde{q}_L^0 \rightarrow q \tilde{\chi}_2^{1/2} \rightarrow q \tilde{l}_R^0 l^{near} \rightarrow q l^+ l^- + \tilde{\chi}_1^0$$

$l = e, \mu$

First emitted lepton ("near")

Due to neutralino spin 1/2, angular distrib. of slepton is not spherically symmetric, invariant mass  $M(q l^{near})$  is charge asymmetric. [Barr]

# Example

## Parton distributions

LHCC5:  $m_0 = 100$  GeV  
 $m_{1/2} = 300$  GeV  
 $A_0 = -300$  GeV  
 $\tan(\beta) = 2.1$   
 $\text{sign}(\mu) = +$

### $M(q|^{near})$

### $M(q|^{far})$

$l^{near}$  and  $l^{far}$  are experimentally indistinguishable. Instead, study of  $M(l^-q)$  and  $M(l^+q)$  distributions. Each distribution contain contribution from both near and far lepton and contribution from both quark and antiquark.

Quark and antiquarks have opposite asymmetries and are experimentally indistinguishable. LHC is pp collider  $\rightarrow$  more quarks than antiquarks will be produced

### $M(q|)$

### asymmetry

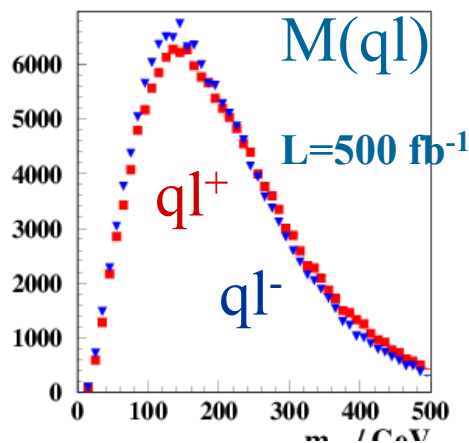

[Barr]

# Asymmetry

LHCC5

$$A = \frac{s^+ - s^-}{s^+ + s^-}$$

$$s^\pm = \frac{d\sigma}{d(m_{l^\pm q})}$$

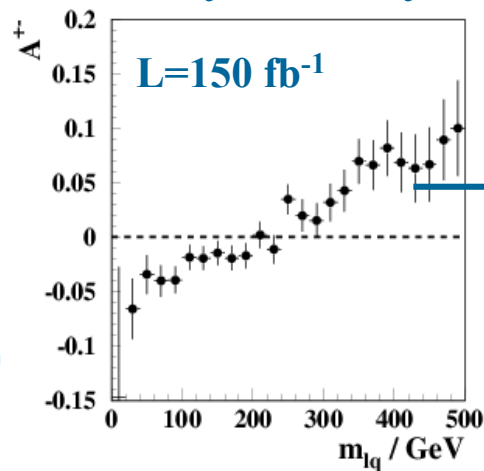

Fast simulation

After selection

Parton level x 0.6

No spin correlations, no asymmetry

asymmetry

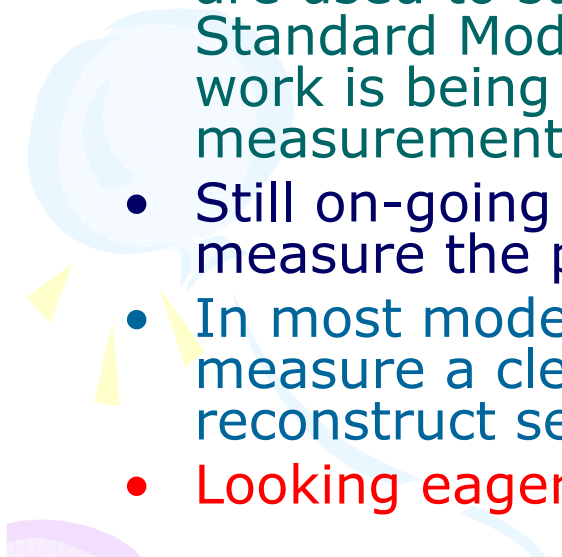

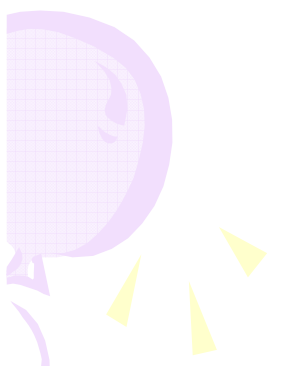

Asymmetry is negative for low values of  $M(lq)$  and positive for large values. This is consistent with spin  $\frac{1}{2}$  neutralino and spin 0 slepton

[Barr]

**SPS1a** Non-zero  $M(ql)$  asymmetry may be observed with  $30\text{fb}^{-1}$   
[Nojiri]

# Summary

- Supersymmetry is one of the priorities of ATLAS studies.
  - Large scale productions on the grid of full simulation data are used to study detector systematic. Knowledge of the Standard Model background is crucial for discovery. Lot of work is being done on SM background computation and measurement from data.
  - Still on-going studies of new models and new techniques to measure the properties of SUSY particles.
  - In most models, a few fb<sup>-1</sup> of data will allow ATLAS to measure a clear excess over the SM contribution and reconstruct several mass relations.
  - **Looking eagerly forward to the first data!**
- 
-
