

HITS AND DIGITS

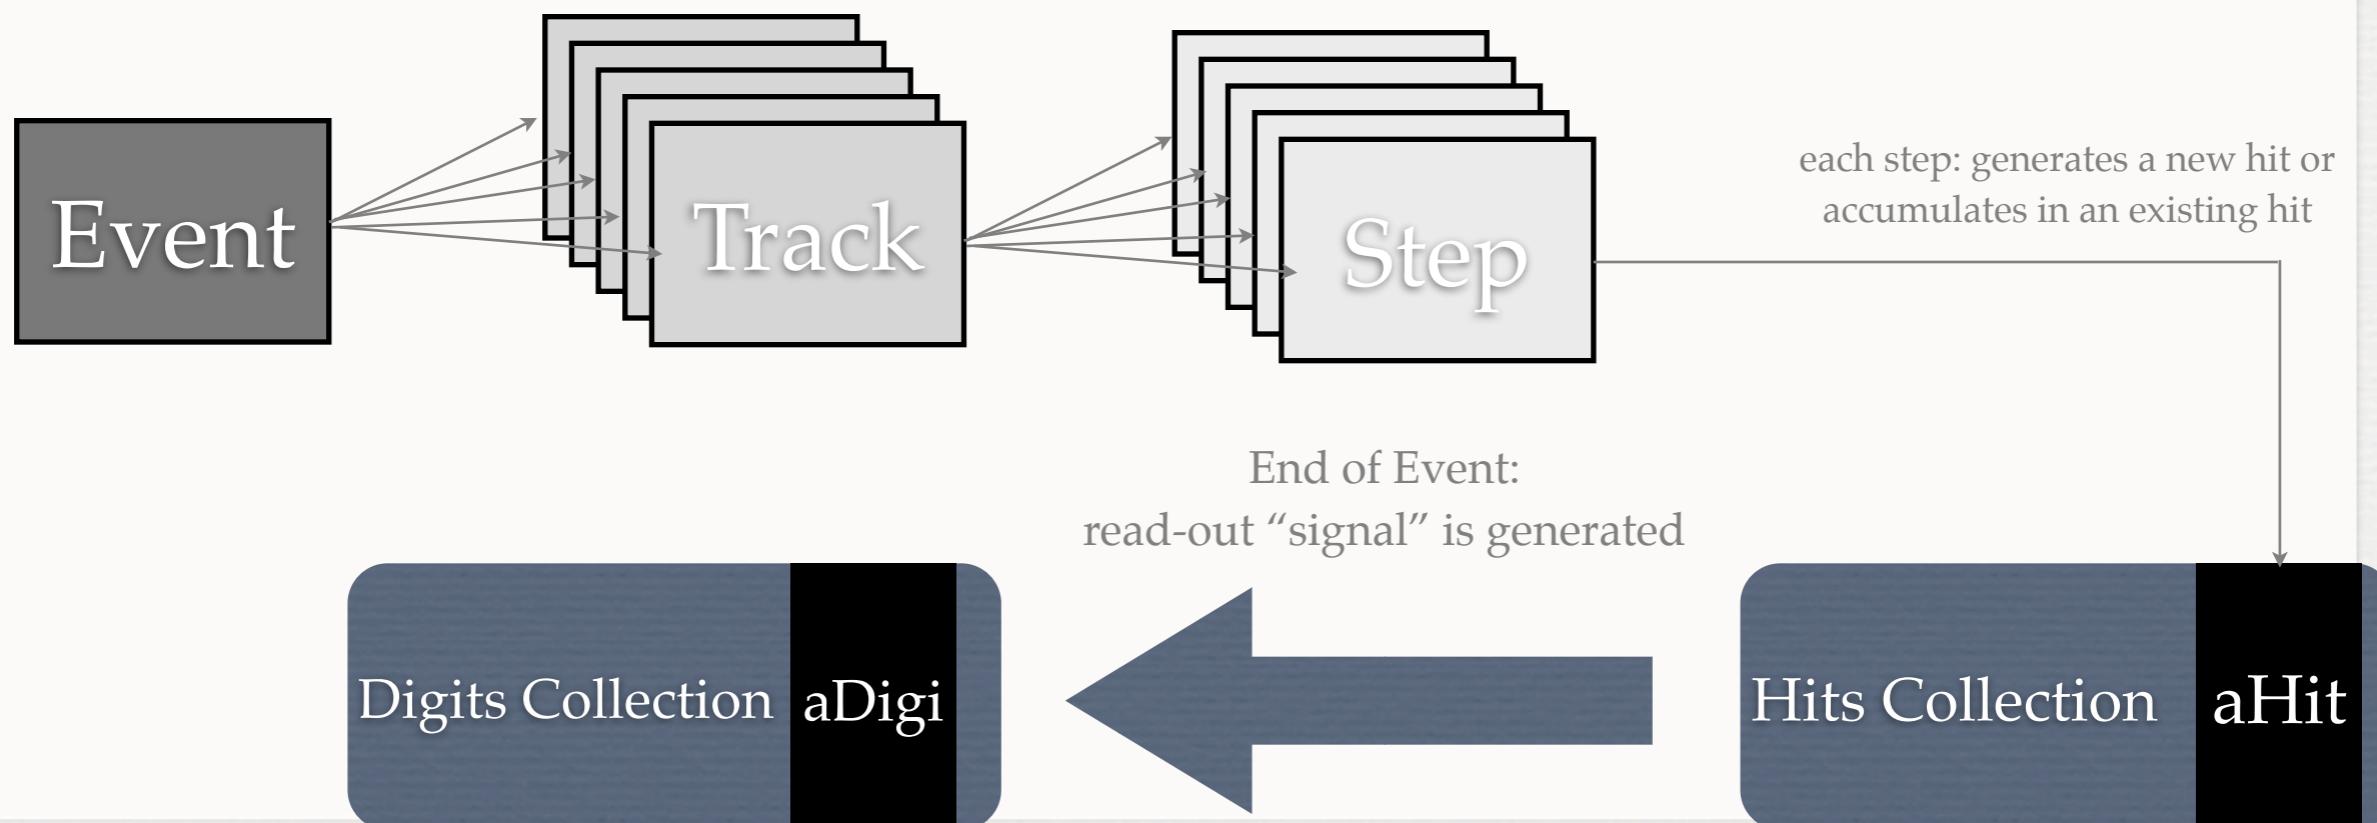

Geant 4

Collecting Information

- User Action allow to interact with the simulation of the physics and collect information for analysis
- Hits simplify the job in collecting information for active parts of the detector
- Hits are created only for the pieces of the detector that are defined sensitive: **SensitiveDetector**.
Example: in a tracker the SD is the active part of the Si wafer, the electronics circuits do not participate in collecting charge, they are not SD thus do not generate hits

Hits Vs Digits

- Hits are a “snapshot” of the physical interaction of a track (step) or an accumulation of interactions of tracks in the sensitive region of the detector, thus hits represent the “true” energy deposited in the detector
- Digits are instead intended to be used to simulate the process of reading-out of the signal: for example “true” energy is transformed into collected charge, electronic noise can be applied together with all instrumental effects

Implementing Your Hit Class

- Hit is a user-defined class derived from G4VHit
- You can store any type of information by implementing your concrete Hit class. For example: position of the step, energy deposition of the step

- See SiHit class: <http://www-zeuthen.desy.de/ILC/geant4/g4course2010/task2/classSiHit.html>

- Accumulates energy of all steps in each strip
- Contains also information about absolute position of the energy deposit

- Hits must be stored in a collection of hits instantiated from G4THitsCollection template class

- G4 provides optimized allocators for memory management

SiHit
planeNumber : int
stripNumber : int
eDep : double
position : G4ThreeVector
isPrimary : bool

Sensitive Detector

- Each **logical volume** can have an associated SD: a user-defined class derived from **G4VSensitiveDetector**
- See **SensitiveDetector** class: <http://www-zeuthen.desy.de/ILC/geant4/g4course2010/task2/classSensitiveDetector.html>
- SDs must have a **unique name**, however **the same SD can be shared between different logical volumes**. In our exercise, the same SD is shared between all Si planes
- SD is created and associated to Si planes of the detector in **DetectorConstruction** class in **Construct** method. See: <http://www-zeuthen.desy.de/ILC/geant4/g4course2010/task2/classDetectorConstruction.html>

The SD Interface - 1

- ❖ Constructor:

```
00028 SensitiveDetector::SensitiveDetector(G4String SDname)  
00029   : G4VSensitiveDetector(SDname)  
00030 {  
00031  
00032   // 'collectionName' is a protected data member of base class  
G4VSensitiveDetector.  
00033   // Here we declare the name of the collection we will be using.  
00034   collectionName.insert("SiHitCollection");  
00035  
00036   // Note that we may add as many collection names we would wish: ie  
00037   // a sensitive detector can have many collections.  
00038 }
```

- ❖ In the constructor, define the name of the hits collection handled by this SD
- ❖ In case your sensitive detector generates more than one kind of hits, define all collection names

The Hits Collection

- ➊ Hits are accumulated in the hits collection
- ➋ Each collection has a unique name (a string): multiple collections can be retrieved by name
- ➌ However searching a string can be time consuming: a unique ID (integer) is also (automatically) associated to each collection
 - Ask G4 which ID corresponds to your name and use ID to get the collection

The SD Interface - 2

- Initialize() method is invoked at beginning of each event
- You can get here the unique ID associated to your collection
- Instantiate the hits collection and attach it to G4HCofThisEvent passed as argument

```
void SensitiveDetector::Initialize(G4HCofThisEvent* HCE)

00087 {
00088     // -- G4cout << "Initialize method of SD `" << GetName() << "' called." << G4endl;
00089
00090     // -----
00091     // -- Creation of the collection
00092     // -----
00093     // -- collectionName[0] as declared in constructor
00094     hitCollection = new SiHitCollection(GetName(), collectionName[0]);
00095
00096     // -----
00097     // -- and attachment of this collection to the "Hits Collection of this Event":
00098     // -----
00099     // -- To insert the collection, we need to get an index for it. This index
00100    // -- is unique to the collection. It is provided by the GetCollectionID(...)
00101    // -- method (which calls what is needed in the kernel to get this index).
00102    static G4int HCID = -1;
00103    if (HCID<0) HCID = GetCollectionID(0); // <<-- this is to get an ID for collectionName[0]
00104    HCE->AddHitsCollection(HCID, hitCollection);
```

The SD Interface - 2

- Initialize() method is invoked **at beginning of each event**
- You can get here the unique ID associated to your collection
- Instantiate the hits collection and attach it to G4HCofThisEvent passed as argument

```
void SensitiveDetector::Initialize(G4HCofThisEvent* HCE)

00087 {
00088     // -- G4cout << "Initialize method of SD `" << GetName() << "' called." << G4endl;
00089
00090     // -----
00091     // -- Creation of the collection
00092     // -----
00093     // -- collectionName[0] as declared in constructor
00094     hitCollection = new SiHitCollection(GetName(), collectionName[0]);
00095
00096     // -----
00097     // -- and attachment of this collection to the "Hits Collection of this Event":
00098     // -----
00099     // -- To insert the collection, we need to get an index for it. This index
00100    // -- is unique to the collection. It is provided by the GetCollectionID(...)
00101    // -- method (which calls what is needed in the kernel to get this index).
00102    static G4int HCID = -1;
00103    if (HCID<0) HCID = GetCollectionID(0); // <<-- this is to get an ID for collectionName[0]
00104    HCE->AddHitsCollection(HCID, hitCollection);
```

The SD Interface - 2

- Initialize() method is invoked at beginning of each event
- You can get here the unique ID associated to your collection
- Instantiate the hits collection and attach it to G4HCofThisEvent passed as argument

```
void SensitiveDetector::Initialize(G4HCofThisEvent* HCE)

00087 {
00088     // -- G4cout << "Initialize method of SD `" << GetName() << "' called." << G4endl;
00089
00090     // -----
00091     // -- Creation of the collection
00092     // -----
00093     // -- collectionName[0] as declared in constructor
00094     hitCollection = new SiHitCollection(GetName(), collectionName[0]);
00095
00096     // -----
00097     // -- and attachment of this collection to the "Hits Collection of this Event":
00098     // -----
00099     // -- To insert the collection, we need to get an index for it. This index
00100    // -- is unique to the collection. It is provided by the GetCollectionID(...)
00101    // -- method (which calls what is needed in the kernel to get this index).
00102    static G4int HCID = -1;
00103    if (HCID<0) HCID = GetCollectionID(0); // <<-- this is to get an ID for collectionName[0]
00104    HCE->AddHitsCollection(HCID, hitCollection);
```

The SD Interface - 3

- For each G4Step occurring in the (logical) volume to which this SD is attached the ProcessHits method is invoked

```
00043 G4bool SensitiveDetector::ProcessHits(G4Step *step, G4TouchableHistory *)
00044 {
00045 // step is guaranteed to be in Strip volume : no need to check for volume
00046
00047 G4TouchableHandle touchable = step->GetPreStepPoint()->GetTouchableHandle();
00048 // energy deposit in this step
00049 G4double edep = step->GetTotalEnergyDeposit();
00050
00051 // get step points in world coordinate system
00052 G4ThreeVector point1 = step->GetPreStepPoint()->GetPosition();
00053 G4ThreeVector point2 = step->GetPostStepPoint()->GetPosition();
00054
00055 // randomize point of energy deposition
00056 G4ThreeVector pointE = point1 + G4UniformRand()*(point2 - point1);
00057
00058
00059 G4int stripCopyNo = touchable->GetReplicaNumber();
00060 G4int planeCopyNo = touchable->GetReplicaNumber(1);
00061
00062
00063 SiHit* hit = new SiHit(stripCopyNo,planeCopyNo,isPrimary);
00064 hitCollection->insert(hit); // size of collection is returned by insert(..)
00065
00066 // set energy deposition
00067 hit->AddEdep(edep);
00068 // store position of energy deposition
00069 hit->SetPosition(pointE);
```

The SD Interface - 3

- For each **G4Step** occurring in the (logical) volume to which this SD is attached the ProcessHits method is invoked

```
00043 G4bool SensitiveDetector::ProcessHits(G4Step *step, G4TouchableHistory *)
00044 {
00045     // step is guaranteed to be in Strip volume : no need to check for volume
00046
00047     G4TouchableHandle touchable = step->GetPreStepPoint()->GetTouchableHandle();
00048     // energy deposit in this step
00049     G4double edep = step->GetTotalEnergyDeposit();  
    Red oval surrounds this line
00050
00051     // get step points in world coordinate system
00052     G4ThreeVector point1 = step->GetPreStepPoint()->GetPosition();
00053     G4ThreeVector point2 = step->GetPostStepPoint()->GetPosition();
00054
00055     // randomize point of energy deposition
00056     G4ThreeVector pointE = point1 + G4UniformRand()*(point2 - point1);
00057
00058
00059     G4int stripCopyNo = touchable->GetReplicaNumber();
00060     G4int planeCopyNo = touchable->GetReplicaNumber(1);
00061
00062
00063     SiHit* hit = new SiHit(stripCopyNo,planeCopyNo,isPrimary);
00064     hitCollection->insert(hit); // size of collection is returned by insert(..)
00065
00066     // set energy deposition
00067     hit->AddEdep(edep);
00068     // store position of energy deposition
00069     hit->SetPosition(pointE);
```

The SD Interface - 3

- For each G4Step occurring in the (logical) volume to which this SD is attached the ProcessHits method is invoked

```
00043 G4bool SensitiveDetector::ProcessHits(G4Step *step, G4TouchableHistory *)
00044 {
00045   // step is guaranteed to be in Strip volume : no need to check for volume
00046
00047   G4TouchableHandle touchable = step->GetPreStepPoint()->GetTouchableHandle();
00048   // energy deposit in this step
00049   G4double edep = step->GetTotalEnergyDeposit();
00050
00051   // get step points in world coordinate system
00052   G4ThreeVector point1 = step->GetPreStepPoint()->GetPosition();
00053   G4ThreeVector point2 = step->GetPostStepPoint()->GetPosition(),
00054
00055   // randomize point of energy deposition
00056   G4ThreeVector pointE = point1 + G4UniformRand()*(point2 - point1);
00057
00058
00059   G4int stripCopyNo = touchable->GetReplicaNumber();
00060   G4int planeCopyNo = touchable->GetReplicaNumber(1);
00061
00062
00063   SiHit* hit = new SiHit(stripCopyNo,planeCopyNo,isPrimary);
00064   hitCollection->insert(hit); // size of collection is returned by insert(..)
00065
00066   // set energy deposition
00067   hit->AddEdep(edep);
00068   // store position of energy deposition
00069   hit->SetPosition(pointE);
```

The SD Interface - 3

- For each G4Step occurring in the (logical) volume to which this SD is attached the ProcessHits method is invoked

```
00043 G4bool SensitiveDetector::ProcessHits(G4Step *step, G4TouchableHistory *)
00044 {
00045   // step is guaranteed to be in Strip volume : no need to check for volume
00046
00047   G4TouchableHandle touchable = step->GetPreStepPoint()->GetTouchableHandle();
00048   // energy deposit in this step
00049   G4double edep = step->GetTotalEnergyDeposit();
00050
00051   // get step points in world coordinate system
00052   G4ThreeVector point1 = step->GetPreStepPoint()->GetPosition();
00053   G4ThreeVector point2 = step->GetPostStepPoint()->GetPosition();
00054
00055   // randomize point of energy deposition
00056   G4ThreeVector pointE = point1 + G4UniformRand()*(point2 - point1);
00057
00058
00059   G4int stripCopyNo = touchable->GetReplicaNumber();
00060   G4int planeCopyNo = touchable->GetReplicaNumber(1);
00061
00062
00063   SiHit* hit = new SiHit(stripCopyNo,planeCopyNo,isPrimary);
00064   hitCollection->insert(hit); // size of collection is returned by insert(..)
00065
00066   // set energy deposition
00067   hit->AddEdep(edep);
00068   // store position of energy deposition
00069   hit->SetPosition(pointE);
```

Step

- Step has two points and “delta” information of a particle (energy loss along the step, time-of-flight, etc)
- Each point knows the volume (and material) associated to it
- A step is always limited by geometry boundaries (i.e. never spans across boundaries)
 - If the step is limited by a boundary, the post-step point stands on the boundary and it logically belongs to the next volume
 - Get the volume information from the PreStepPoint

Touchable: Locate A Hit

- It would be too complex to locate which strip the step belongs to from its position (G4ThreeVector). **Each G4Step knows which volume it is in.**
- Example: the detector you have built in Task1.1 is made of 3 identical planes of Si, each one made of 48 identical strips
- Strips have been created as “replica”
 - In memory there is only one volume object “strip”. **Its position is parametrized by its replica number**
 - We also need the number of the “mother volume” containing the strip: **the plane number**
- Touchables can retrieve these numbers

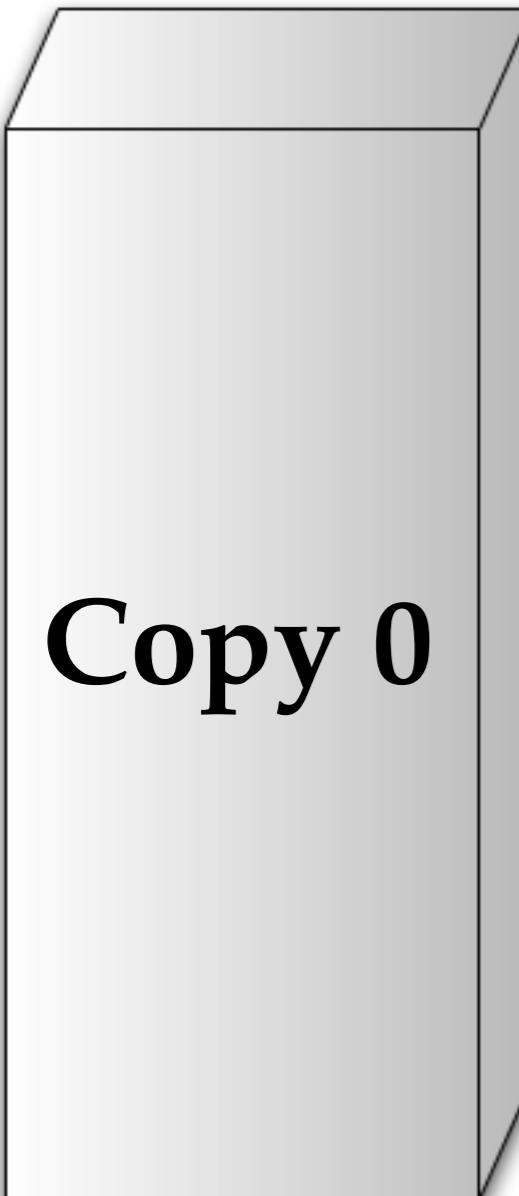

Remember: PostStep belongs to NEXT volume, use PreStepPoint!

```
00047 G4TouchableHandle touchable = step->GetPreStepPoint()->GetTouchableHandle();  
00069 G4int stripCopyNo = touchable->GetReplicaNumber();  
00070 G4int planeCopyNo = touchable->GetReplicaNumber(1);
```

Go up by one in hierarchy: the plane

Touchable: Locate

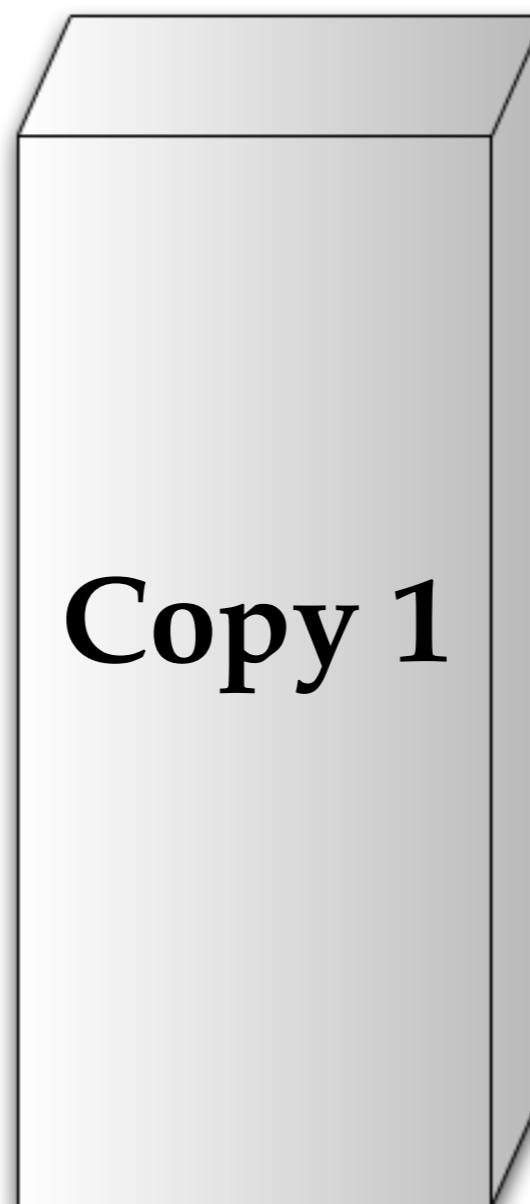

- It would be too complex to position (G4ThreeVector). Example: the detector you have of 48 identical assemblages is only its replica number.

Retrieving Hits

- Hits collections can be retrieved by name.
 - First retrieve the collection ID
- Hits are associated to the current G4Event object, it is possible to retrieve the hits collection:

```
void EventAction::EndOfEventAction(const G4Event* anEvent)
00049 {
00044   G4SDManager * SDman = G4SDManager::GetSDMpointer();
00045   G4int hitsCollID = SDman->GetCollectionID(hitsCollName);
00061   //Retrieve digits collection
00065   G4HCofThisEvent* hitsCollections = anEvent->GetHCofThisEvent();
00066   SiHitCollection* hits = 0;
00069   hits = static_cast<SiHitCollection*>( hitsCollections->GetHC
(hitsCollID) );
```

Retrieving Hits

- Hits collections can be retrieved by name.
 - First retrieve the collection ID
- Hits are associated to the current G4Event object, it is possible to retrieve the hits collection:

```
void EventAction::EndOfEventAction(const G4Event* anEvent)
00049 {
00044   G4SDManager * SDman = G4SDManager::GetSDMpointer();
00045   G4int hitsCollID = SDman->GetCollectionID(hitsCollName);
00061   //Retrieve digits collection
00065   G4HCofThisEvent* hitsCollections = anEvent->GetHCofThisEvent();
00066   SiHitCollection* hits = 0;
00069   hits = static_cast<SiHitCollection*>( hitsCollections->GetHC
(hitsCollID) );
```

Digitization

- At the end of one event the G4HCofThisEvent object contains the hits we have created
- The **Digitizer module** (electronic read-out simulator) can be used **to transform Hits to Digits**
- SiDigi class, inherits from G4VDigi. Digits are stored in container, an instance of G4TDigiCollection class: very similar to hits mechanism
- See: <http://www-zeuthen.desy.de/ILC/geant4/g4course2010/task2/classSiDigi.html>

Digitizer

- Digitizer is identified by name and has to be registered to the DigiManager singleton
- The SiDigitizer class inherits from G4VDigitizerModule base class and implements the Digitize() method
 - Warning: this method has to be called explicitly at the end of the event

```
EventAction::EventAction()
00026 {
00027     //We build the digitization module
00028     SiDigitizer* digitizer = new SiDigitizer("SiDigitizer");
00029     G4DigiManager * digiManager = G4DigiManager::GetDMpointer();
00030     digiManager->AddNewModule( digitizer );
00031 }
```

```
00048 void EventAction::EndOfEventAction(const G4Event* anEvent)
00049 {
00050     //Digitize!!
00051     G4DigiManager * digiManager = G4DigiManager::GetDMpointer();
00052     SiDigitizer* digiModule = static_cast<SiDigitizer*>( digiManager-
>FindDigitizerModule("SiDigitizer") );
00055         digiModule->Digitize();
```

Digitizer

- Digitizer is identified by name and has to be registered to the DigiManager singleton
- The SiDigitizer class inherits from G4VDigitizerModule base class and implements the Digitize() method
 - Warning: this method has to be called explicitly at the end of the event

```
EventAction::EventAction()
00026 {
00027     //We build the digitization module
00028     SiDigitizer* digitizer = new SiDigitizer("SiDigitizer");
00029     G4DigiManager * digiManager = G4DigiManager::GetDMpointer();
00030     digiManager->AddNewModule( digitizer );
00031 }
```

```
00048 void EventAction::EndOfEventAction(const G4Event* anEvent)
00049 {
00050     //Digitize!!
00051     G4DigiManager * digiManager = G4DigiManager::GetDMpointer();
00052     SiDigitizer* digiModule = static_cast<SiDigitizer*>( digiManager-
>FindDigitizerModule("SiDigitizer") );
00055         digiModule->Digitize();
```

Digitizer

- Digitizer creates the digit collection, similarly to hits, these are identified by a collection name

```
00021 SiDigitizer::SiDigitizer(C4String aName) :  
00022 G4VDigitizerModule(aName)  
00043 {  
00044     collectionName.push_back( digiCollectionName );  
00047 }
```

- Digits are created and added to the collection:

```
00049 void SiDigitizer::Digitize()  
00050 {  
00052     SiDigiCollection * digiCollection = new SiDigiCollection("SiDigitizer",digiCollectionName);  
00053     //Create a empty collection with one digits for each strip  
00055     const G4int numPlanes = 3;    //Number of Si detectors  
00056     const G4int numStrips = 48;   //Number of strip per plane  
00067     for ( G4int plane = 0 ; plane < numPlanes ; ++plane ) {  
00068         for ( G4int strip = 0 ; strip < numStrips ; ++strip )  
00069         {  
00070             SiDigi* newDigi = new SiDigi(plane,strip);  
00072             digiCollection->insert(newDigi);  
00073         }  
00074     }  
00129     StoreDigiCollection(digiCollection);
```

Digitizer

- Digitizer creates the digit collection, similarly to hits, these are identified by a collection name

```
00021 SiDigitizer::SiDigitizer(G4String aName) :  
00022   G4VDigitizerModule(aName)  
00043 {  
00044     collectionName.push_back( digiCollectionName );  
00047 }
```

- Digits are created and added to the collection:

```
00049 void SiDigitizer::Digitize()  
00050 {  
00052   SiDigiCollection * digiCollection = new SiDigiCollection("SiDigitizer",digiCollectionName);  
00053   //Create a empty collection with one digits for each strip  
00055   const G4int numPlanes = 3; //Number of Si detectors  
00056   const G4int numStrips = 48; //Number of strip per plane  
00067   for ( G4int plane = 0 ; plane < numPlanes ; ++plane ) {  
00068     for ( G4int strip = 0 ; strip < numStrips ; ++strip )  
00069     {  
00070       SiDigi* newDigi = new SiDigi(plane,strip);  
00072       digiCollection->insert(newDigi);  
00073     }  
00074   }  
00129   StoreDigiCollection(digiCollection);
```

Digitizer

- Digitizer creates the digit collection, similarly to hits, these are identified by a collection name

```
00021 SiDigitizer::SiDigitizer(G4String aName) :  
00022   G4VDigitizerModule(aName)  
00043 {  
00044     collectionName.push_back( digiCollectionName );  
00047 }
```

- Digits are created and added to the collection:

```
00049 void SiDigitizer::Digitize()  
00050 {  
00052   SiDigiCollection * digiCollection = new SiDigiCollection("SiDigitizer",digiCollectionName);  
00053   //Create a empty collection with one digits for each strip  
00055   const G4int numPlanes = 3; //Number of Si detectors  
00056   const G4int numStrips = 48; //Number of strip per plane  
00067   for ( G4int plane = 0 ; plane < numPlanes ; ++plane ) {  
00068     for ( G4int strip = 0 ; strip < numStrips ; ++strip )  
00069     {  
00070       SiDigi* newDigi = new SiDigi(plane,strip);  
00072       digiCollection->insert(newDigi);  
00073     }  
00074   }  
00129   StoreDigiCollection(digiCollection);
```

Digitizer

- Digitizer creates the digit collection, similarly to hits, these are identified by a collection name

```
00021 SiDigitizer::SiDigitizer(G4String aName) :  
00022   G4VDigitizerModule(aName)  
00043 {  
00044     collectionName.push_back( digiCollectionName );  
00047 }
```

- Digits are created and added to the collection:

```
00049 void SiDigitizer::Digitize()  
00050 {  
00052   SiDigiCollection * digiCollection = new SiDigiCollection("SiDigitizer",digiCollectionName);  
00053   //Create a empty collection with one digits for each strip  
00055   const G4int numPlanes = 3; //Number of Si detectors  
00056   const G4int numStrips = 48; //Number of strip per plane  
00067   for ( G4int plane = 0 ; plane < numPlanes ; ++plane ) {  
00068     for ( G4int strip = 0 ; strip < numStrips ; ++strip )  
00069     {  
00070       SiDigi* newDigi = new SiDigi(plane,strip);  
00072       digiCollection->insert(newDigi);  
00073     }  
00074   }  
00129   StoreDigiCollection(digiCollection);
```

Retrieving Digits

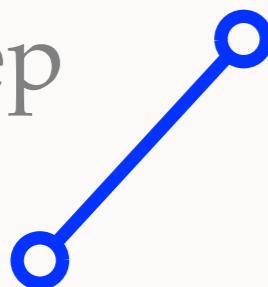

- ➊ Digits collection can be retrieved, by name, via the DigiManager singleton

```
00051 G4DigiManager * digiManager = G4DigiManager::GetDMpointer();  
00062 G4int digiCollID = digiManager->GetDigiCollectionID( digitsCollName );  
00063 const SiDigiCollection* digits = static_cast<const SiDigiCollection*>  
( digiManager->GetDigiCollection(digiCollID) );
```

- ➋ Remember retrieval is always a two-step process:
name (string) \Rightarrow ID (integer) \Rightarrow collection (pointer)
- ➌ Since IDs do not change during a run you can (should) optimize your code: do the first search only once
