26 September 2019

The eRMC and RMM program at CERN

eRMC

Enhanced Racetrack Model Coil

16 T mid-plane field

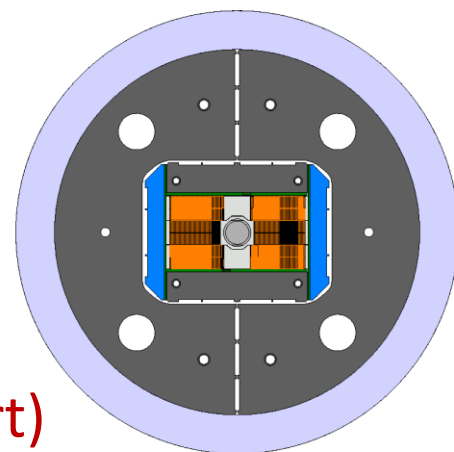

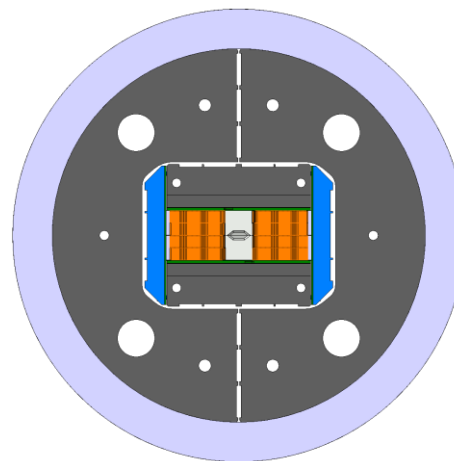

- Demonstrate field on the conductor
- Coil technology development

RMM

Racetrack Model Magnet

16 T in a 50 mm cavity

- Demonstrate field on the aperture
- Mechanics (including inner coil support)

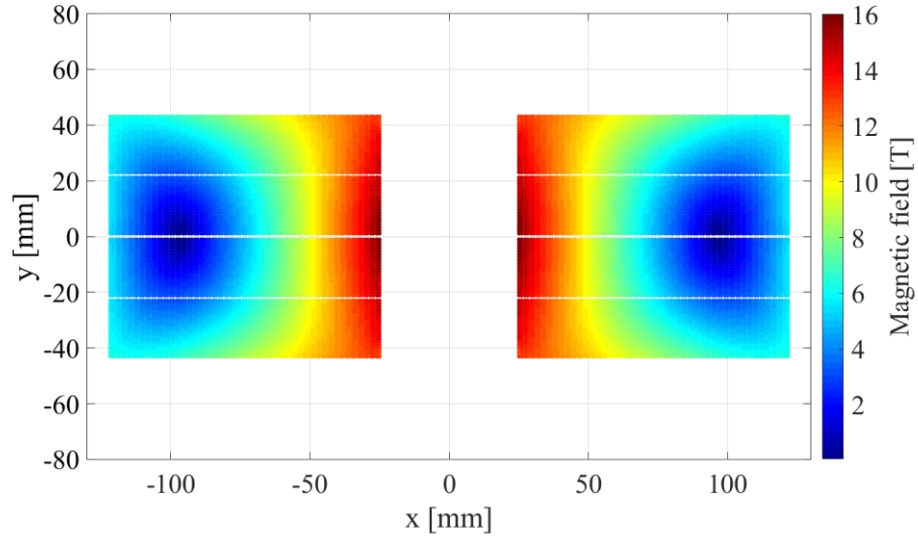

Base for the development of the technology needed for the 16 T dipole program

Magnetic field maps calculated using ROXIE

TABLE I
2-D MAGNET PARAMETERS

Parameter	Unit	ERMC	RMM
Closed aperture diameter	mm	8	50
Aluminum shell thickness	mm	70	70
Magnet outer diameter	mm	800	800
Number of turns per quadrant	–	90	132
Nominal current I_{nom}	kA	13.13	11.40
Insulated cond. current density at I_{nom}	A/mm ²	282	245
Nominal bore field B_{nom}	T	15.7	16.0
Coil peak field at I_{nom}	T	16.00	16.15
Short sample current I_{ss} at 4.2 K	kA	14.38	12.66
Coil peak field at 4.2 K I_{ss}	T	17.28	17.72
Short sample current I_{ss} at 1.9 K	kA	15.91	14.05
Coil peak field at 1.9 K I_{ss}	T	18.90	19.39
Stored energy per unit length at I_{nom}	MJ/m	1.5	2.1
Inductance per unit length at I_{nom}	mH/m	16.6	31.1
F_x per quadrant at I_{nom}	MN/m	5.86	8.03
F_y per quadrant at I_{nom}	MN/m	–3.34	–4.05

Focus of today's presentation

Design of the **quench protection systems**
for **full-scale** [**14.3 m**] eRMC and RMM magnets

Main features:

- **CLIQ** technology
- **Multi-physics** analysis with STEAM-LEDET
- Analysis of transients at **all current levels**

Quench protection of the 16 T Nb₃Sn ERM and RMM dipole magnets

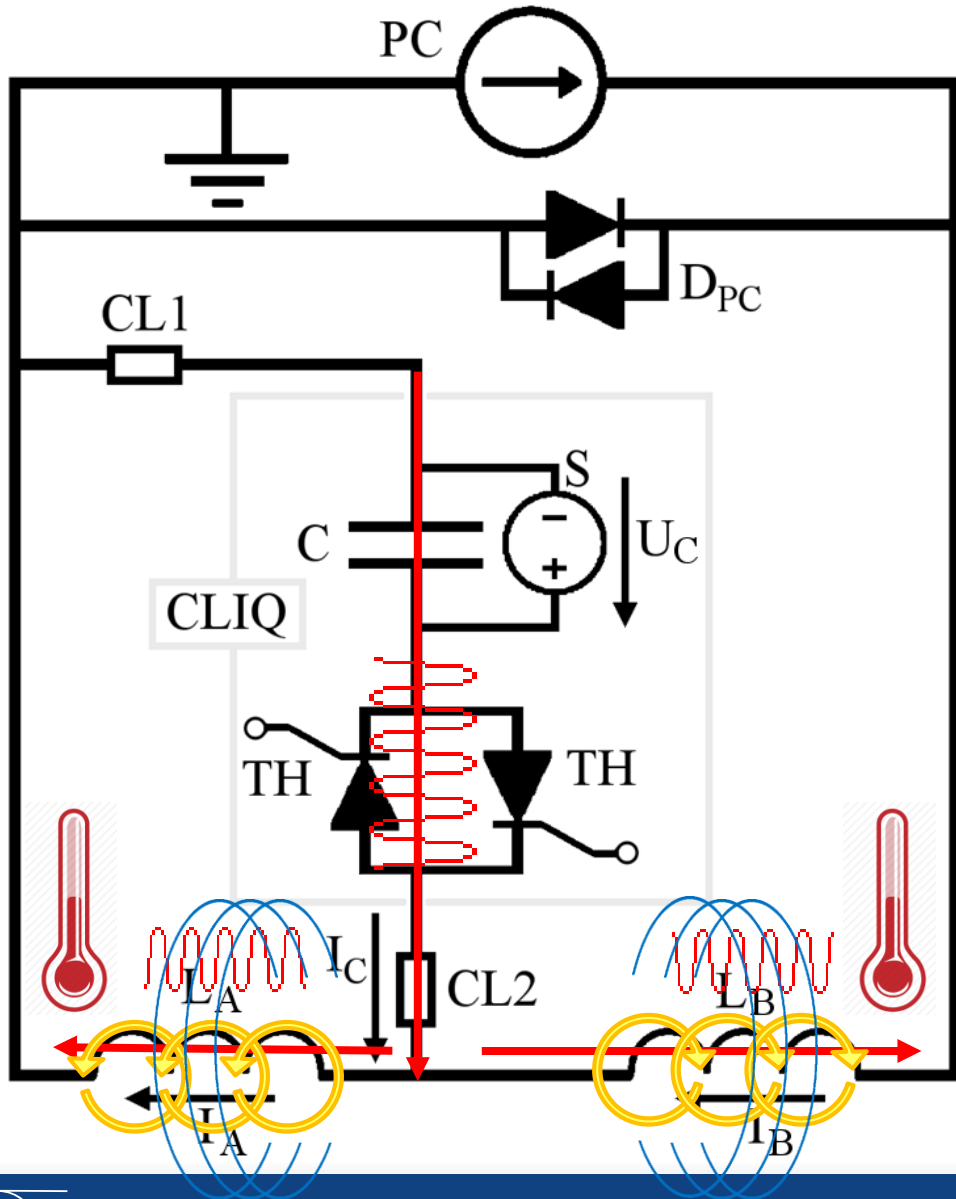

Quench protection based on CLIQ

Modelling with STEAM-LEDET

eRM magnet quench protection

RMM magnet quench protection

CLIQ (Coupling-Loss Induced Quench) technology

Current change

Magnetic field change

Coupling losses (Heat)

Temperature rise

Coil SC \rightarrow resistive

Magnet current discharged

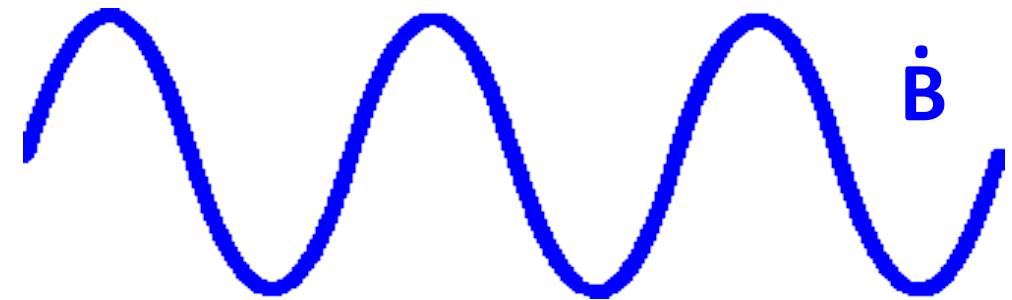

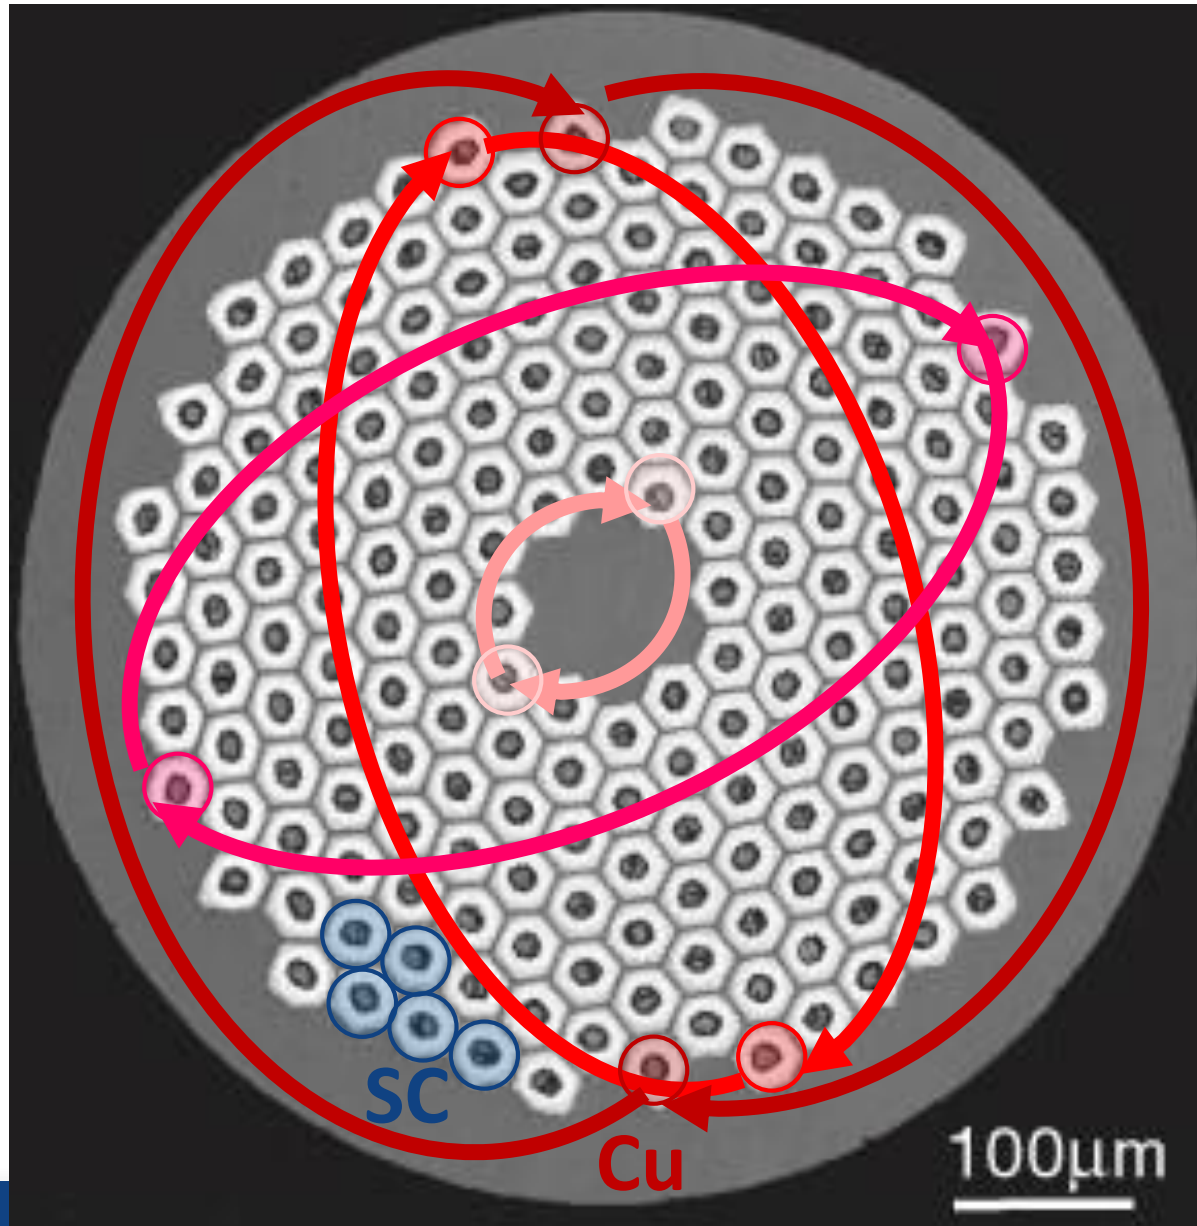

Reduced hot-spot temperature

Main CLIQ ingredients

- **Connection** scheme
- Capacitance **C**
- Charging voltage **U_0**

[1] G. Kirby, V. Datskov, E. Ravaoli, Patent EP13174323.9, 2013
[2] E. Ravaoli, [“CLIQ”, PhD thesis](#), 2015

Inter-filament coupling loss

“Fast” loss:

Characteristic time constant in the order of **ms** or **tens of ms**

Deposited **power** density roughly proportional to **$(dB/dt)^2$**

CLIQ advantages & disadvantages with respect to conventional technology

- More **effective** energy deposition
- **Faster** and more **homogeneous** quench initiation

- **More robust** electrical design
- **Easier** to implement and repair
- Lower expected **failure rate**

- **Integration** in the magnet circuit to be studied

- Internal **voltage distribution** to be carefully analyzed

- **Redundancy** of the system

CLIQ technology tests

Name	Where	Year	Geometry	Superconductor	Stored energy [MJ]
Small-scale solenoid	CERN	2013	Solenoid	Nb-Ti	0.04
Solenoid system	Private	2014	Solenoid	Nb ₃ Sn	-
MQXC2	CERN	2014	Quadrupole	Nb-Ti	1.10
HQ	CERN	2014	Quadrupole	Nb ₃ Sn	0.60
MQY	CERN	2015	Twin-aperture quadrupole	Nb-Ti	0.96
MB	CERN	2015	Twin-aperture dipole	Nb-Ti	6.88
MQXF	FNAL	2016-2019	Quadrupole	Nb ₃ Sn	1.46
→Baseline for HL-LHC inner triplet magnets	CERN	2017-2019	Quadrupole	Nb ₃ Sn	1.46
	BNL	2018-2019	Quadrupole	Nb ₃ Sn	4.91
11T dipole	CERN	2017	Twin-aperture dipole	Nb ₃ Sn	1.94
PUP4	NHMFL	2017	Solenoid	Bi-2212	0.3E-3

...and more in the pipeline

CLIQ was tested in 7 different test facilities on **more than 15 magnets** with different superconductor types (Nb-Ti, Nb₃Sn, Bi-2212), geometries, and magnet sizes

Quench protection of the 16 T Nb₃Sn ERM C and RMM dipole magnets

Quench protection based on CLIQ

Modelling with STEAM-LEDET

eRMC magnet quench protection

RMM magnet quench protection

LEDET in a nutshell

Tool to simulate **electro-magnetic** and **thermal** transients in superconducting magnets.

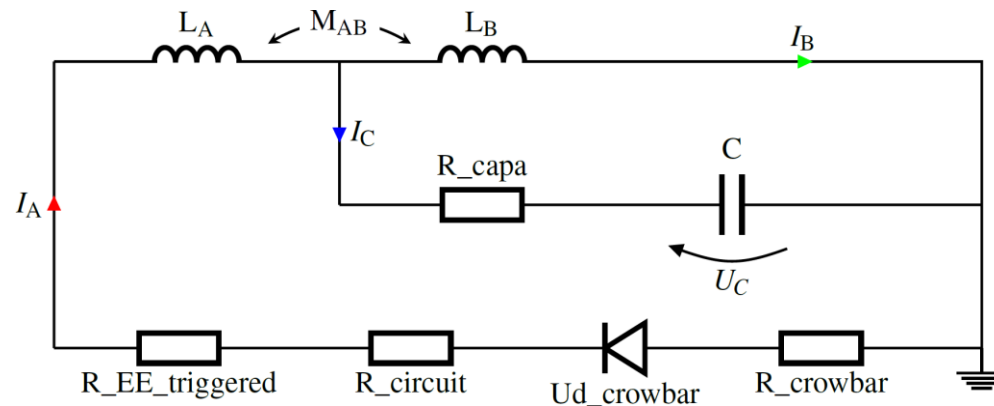

- **2D** magnet model + simplified electrical circuit
- Magnetic **field maps** and inductance dependence on **iron yoke saturation** calculated externally (usually with ROXIE)
- **Inter-filament and inter-strand coupling currents included**
- Turn-to-turn **heat exchange**, simplified **helium cooling** included
- **Energy-extraction, quench heaters, CLIQ** transients simulated
- Comes as a .exe file. A typical simulation runs in **~2 minutes**.

Key feature for CLIQ simulations

<https://cern.ch/steam>

Framework to simulate **transient effects** in superconducting magnets and circuits

Quench protection of the 16 T Nb₃Sn ERM C and RMM dipole magnets

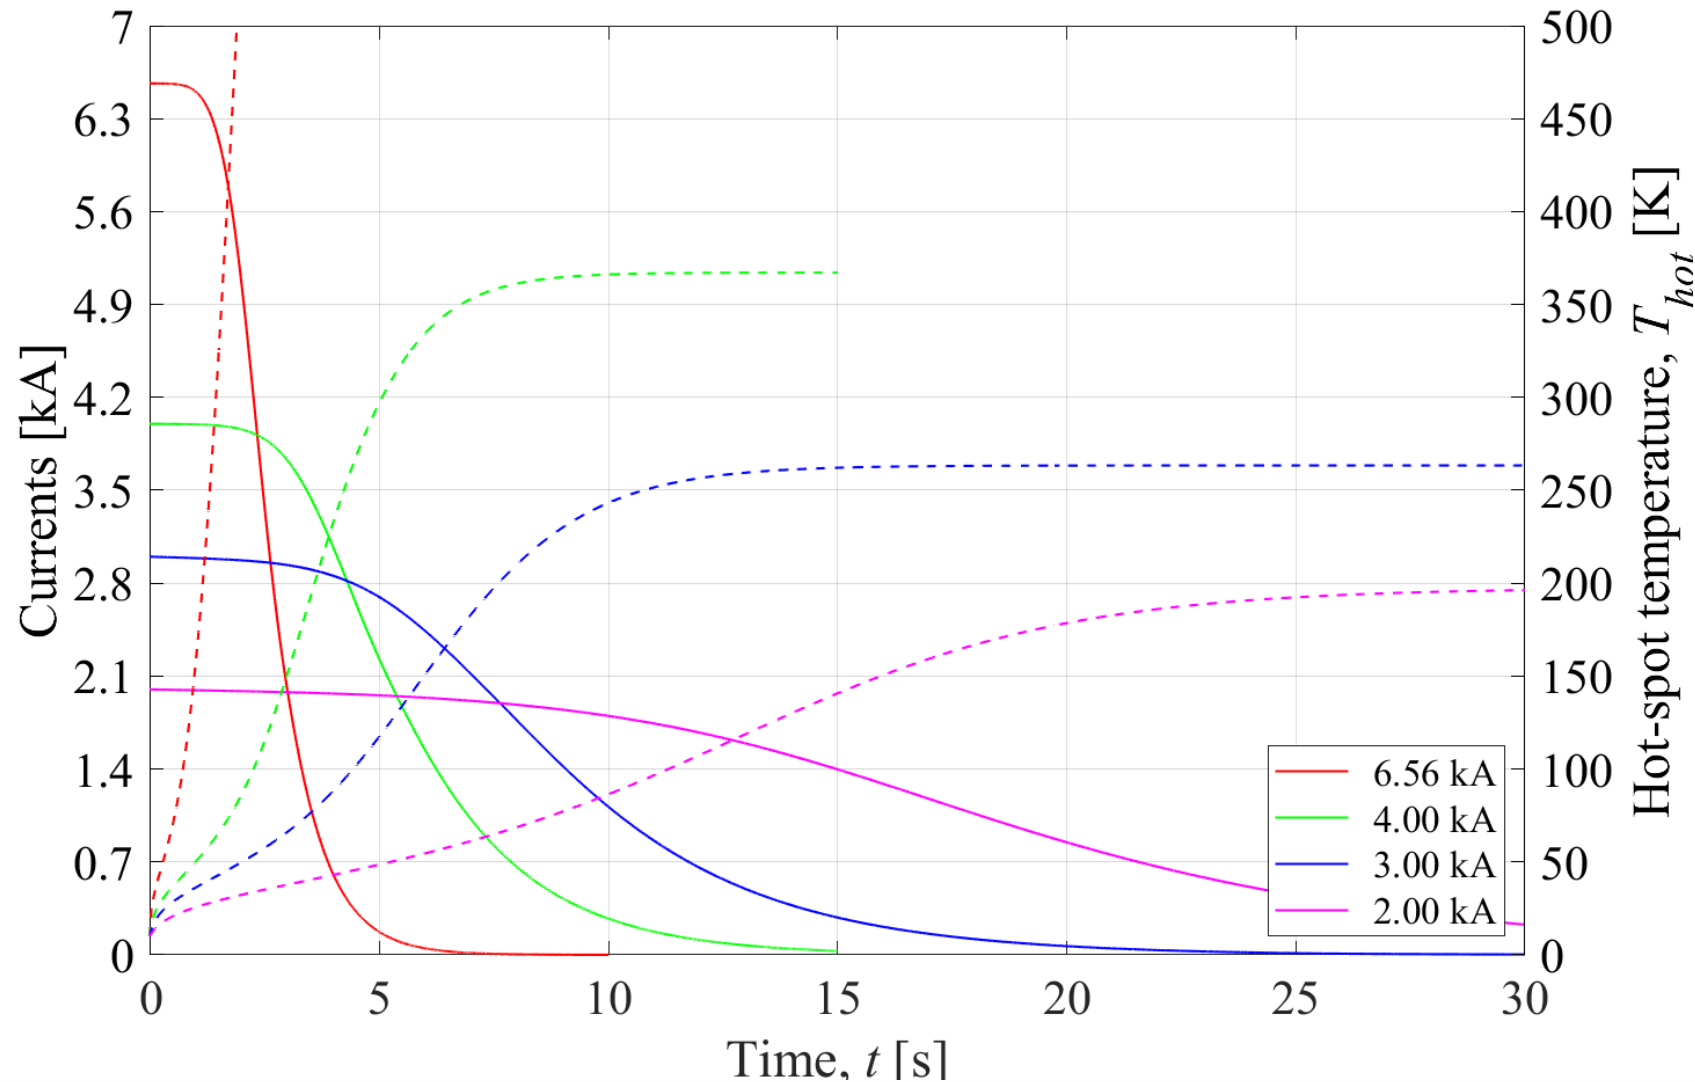

Quench protection based on CLIQ

Modelling with STEAM-LEDET

eRMC magnet quench protection

RMM magnet quench protection

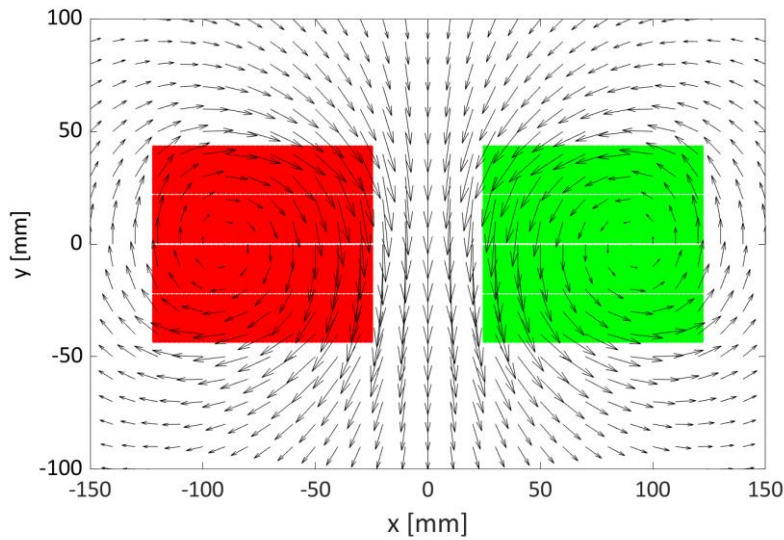

eRMC – Self-protectability

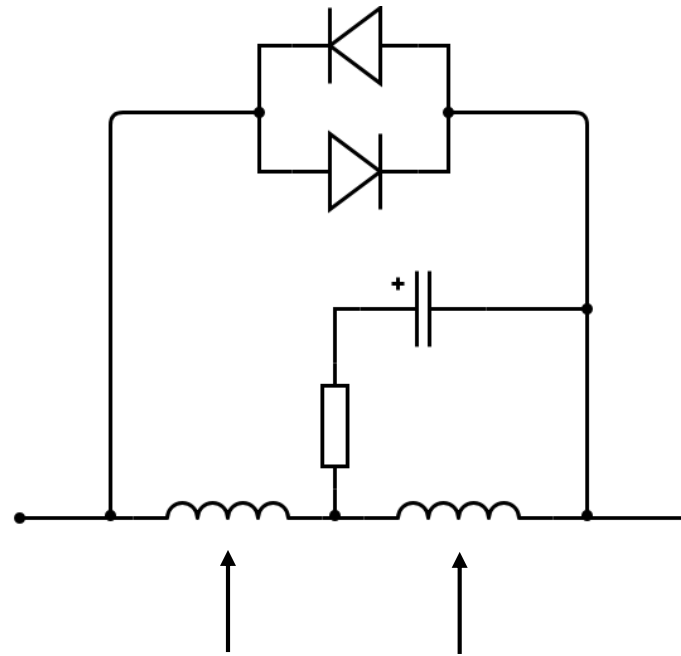

Magnet self-protected
for currents ≤ 3 kA
Assumed $v_Q = 2.5$ m/s

Above $\sim 20\%$ of nominal
current, **active
protection is needed**

eRMC – CLIQ connection scheme (per aperture)

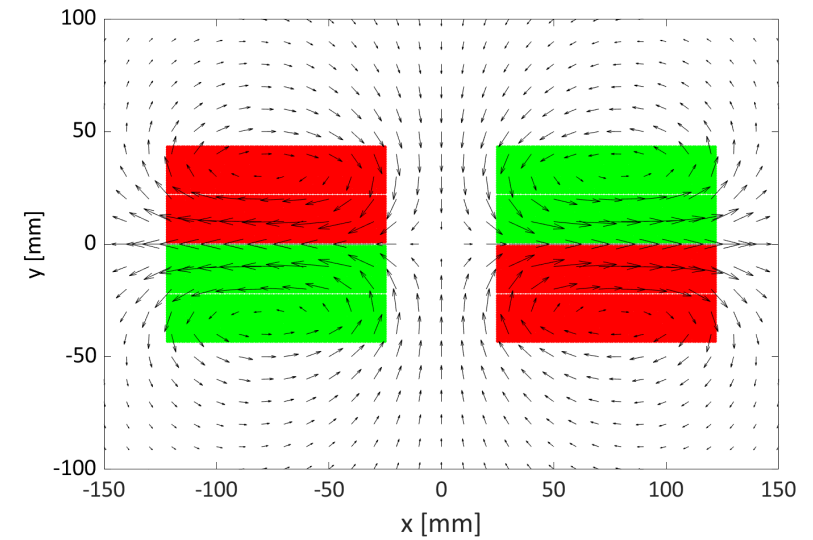

Normal operation DC
current polarities and
magnetic field

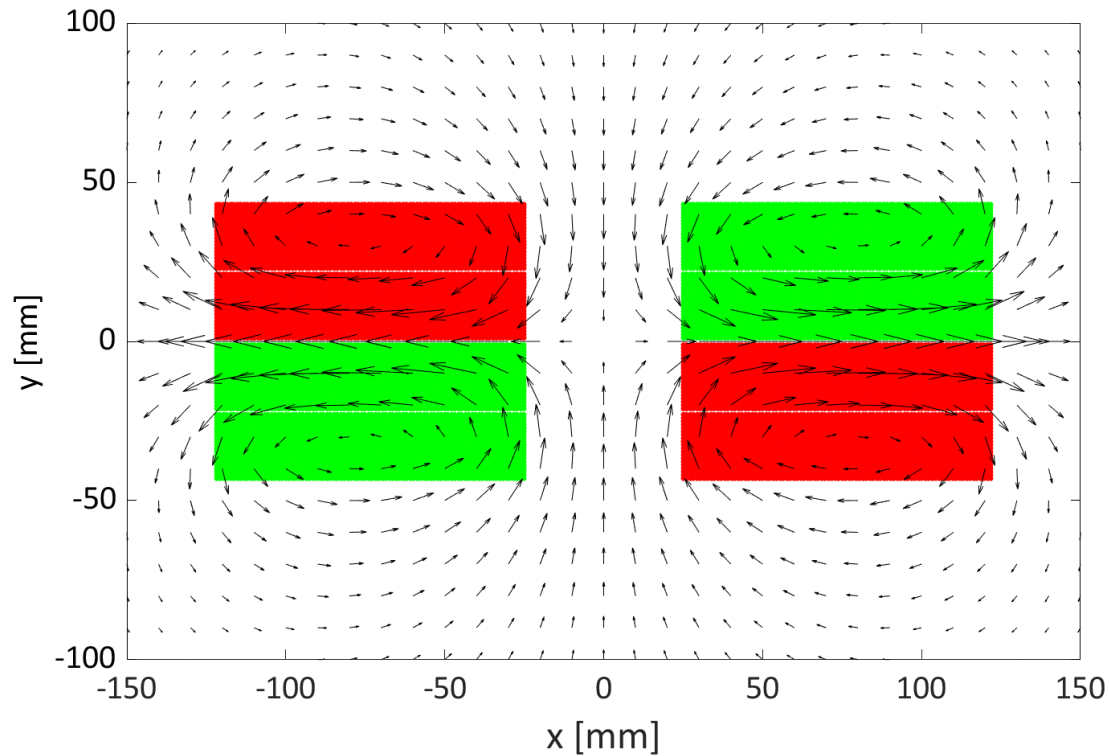

Upper pole Lower pole

Simplified CLIQ circuit

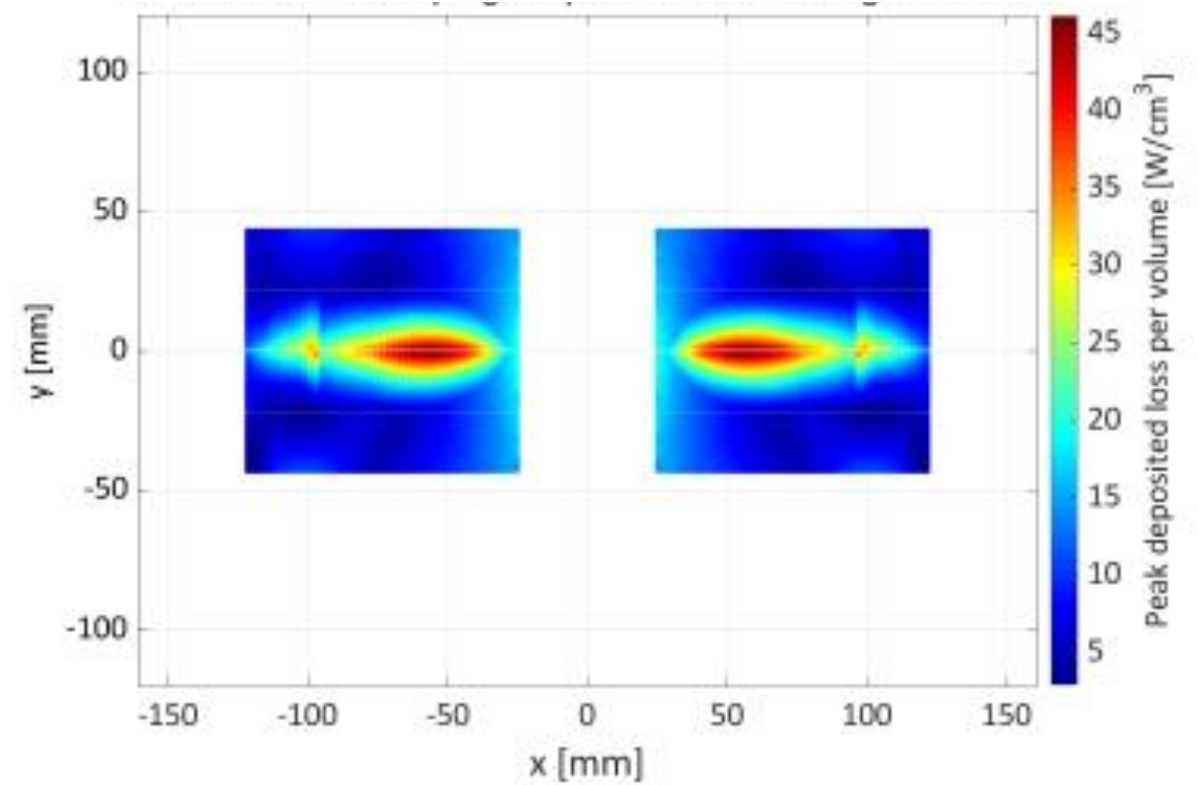

CLIQ-induced oscillating
current polarities and
magnetic field

eRMC – Generation of inter-filament coupling loss

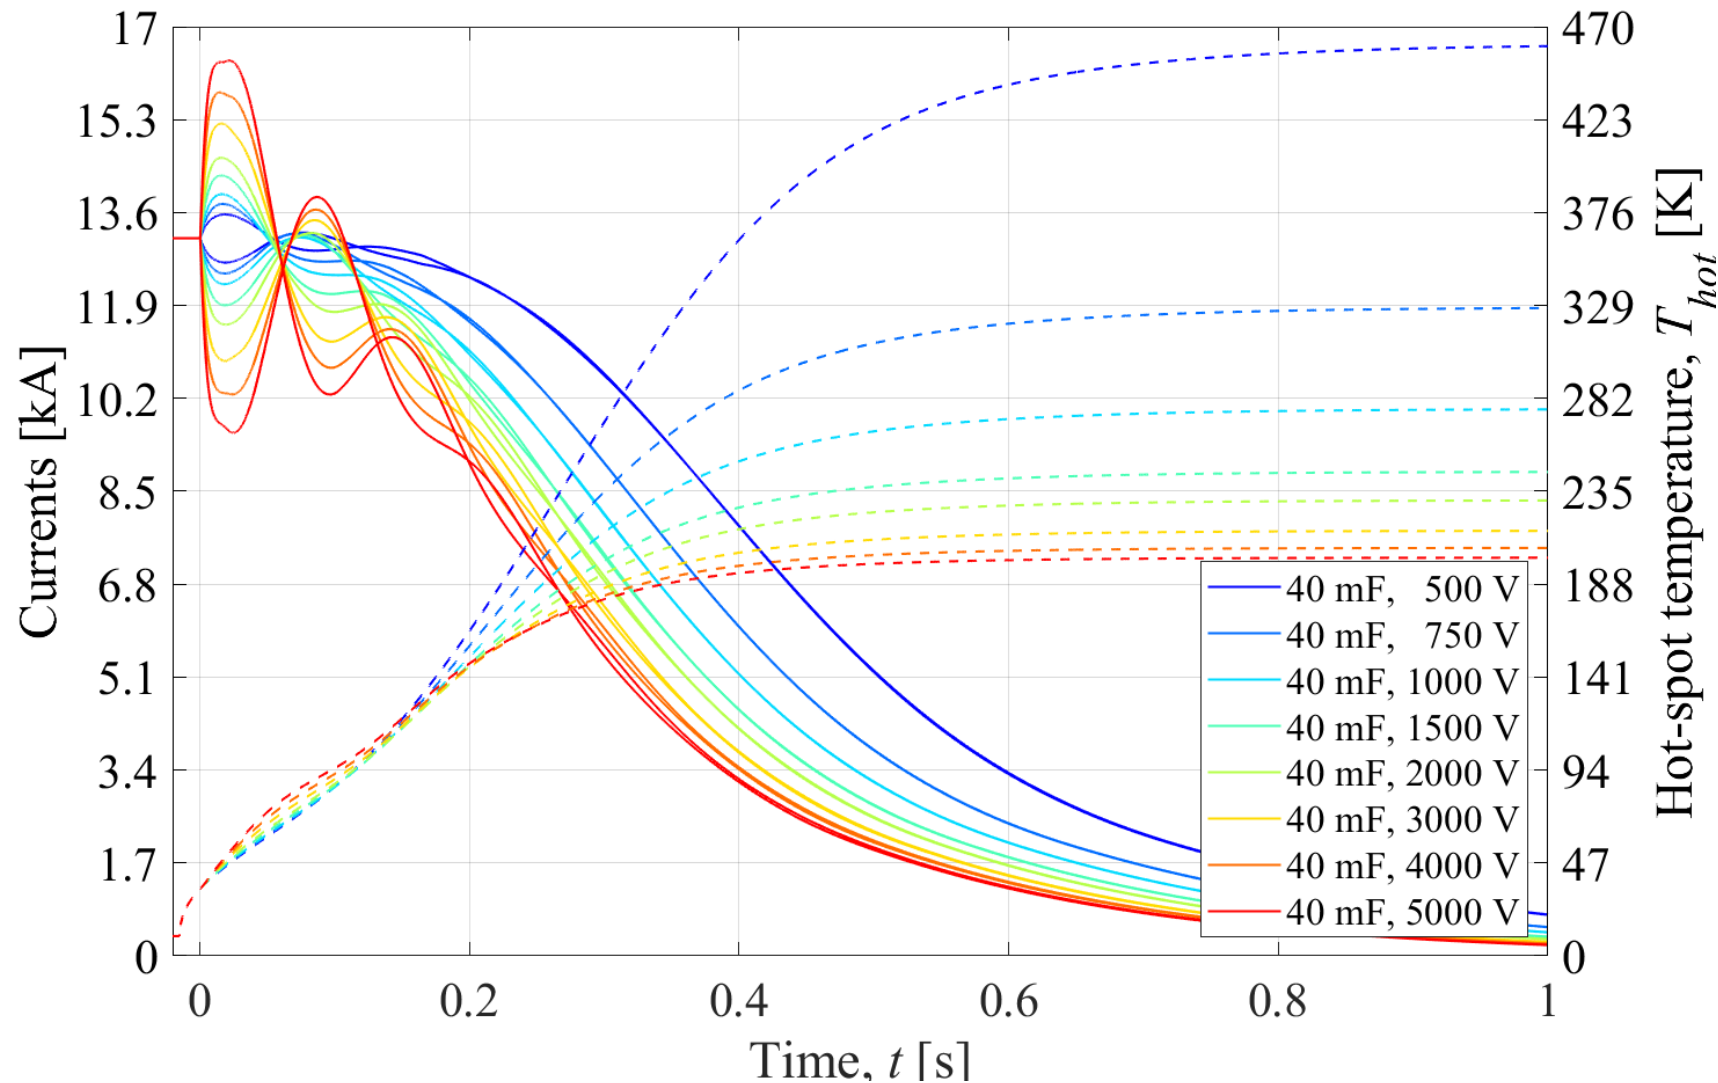

Oscillating current polarities
and **magnetic field**

Peak inter-filament
coupling loss (**heat**)

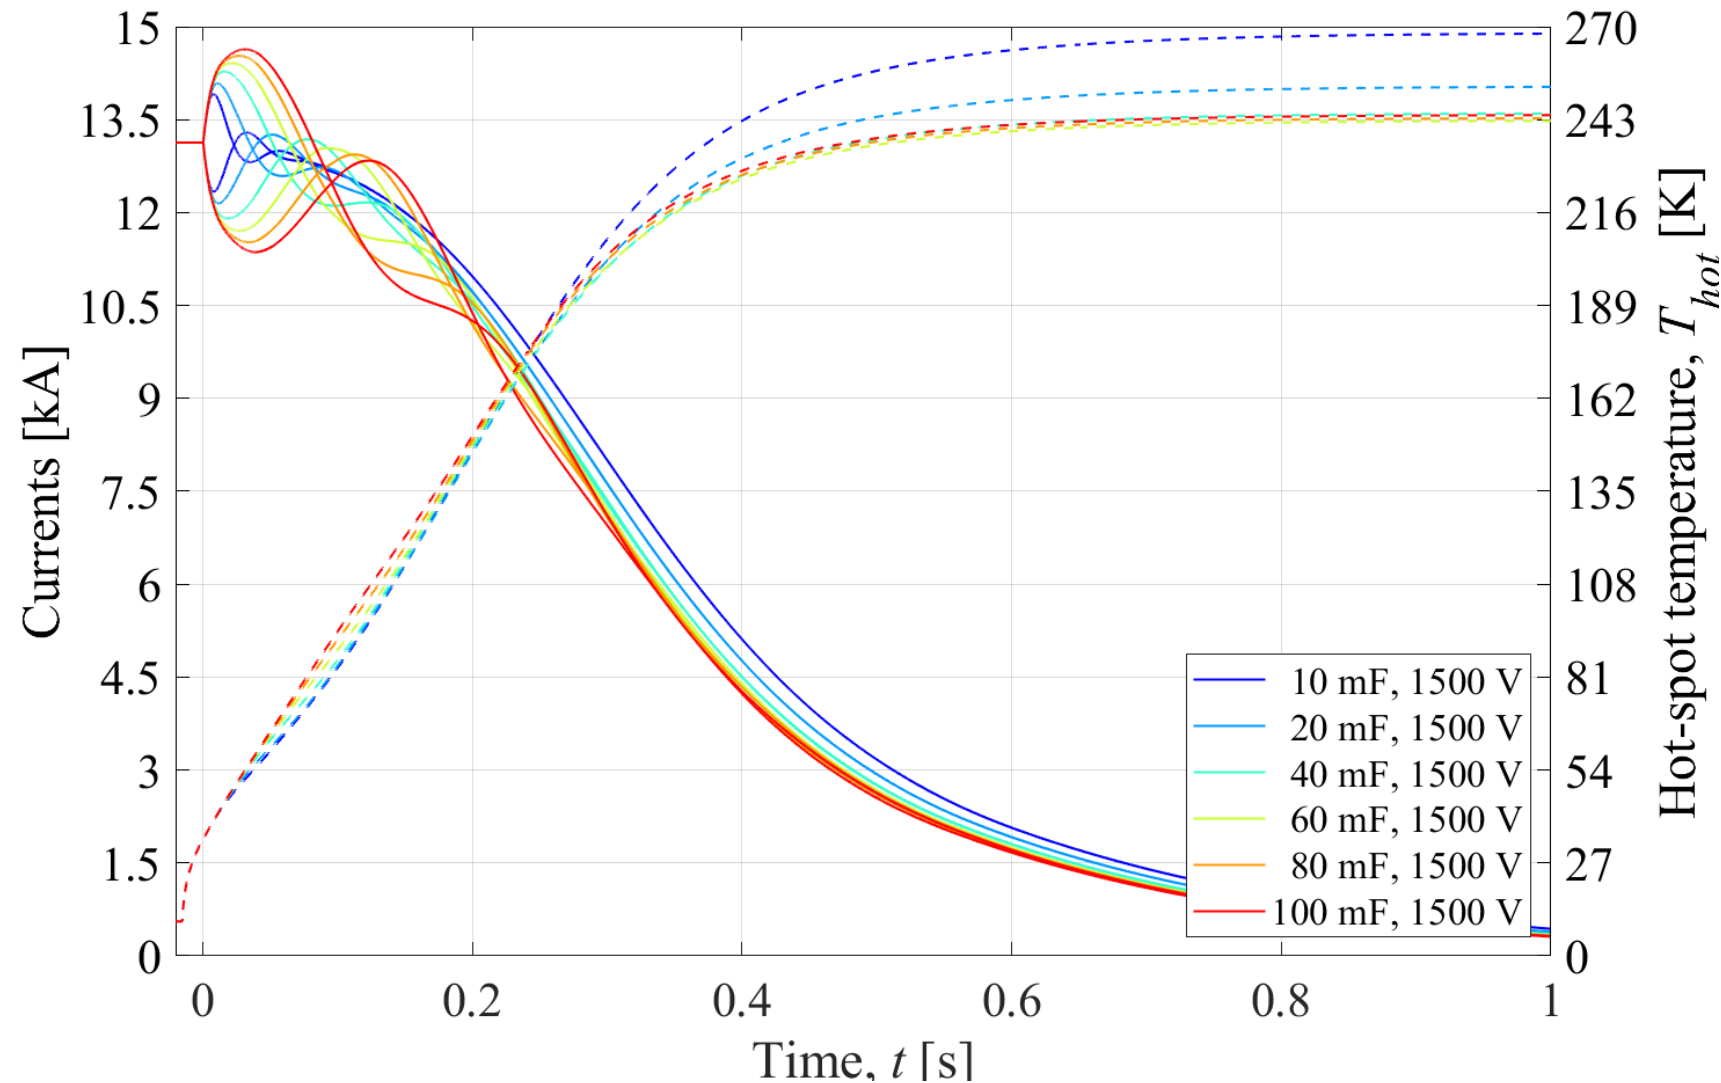

eRMC – Quench protection at I_{nom} – Effect of CLIQ voltage U_0

In first approximation:

Peak current	$\propto U_0$
Current rate	$\propto U_0$
Power	$\propto U_0^2$
Energy	$\propto U_0^2$
Frequency	\sim

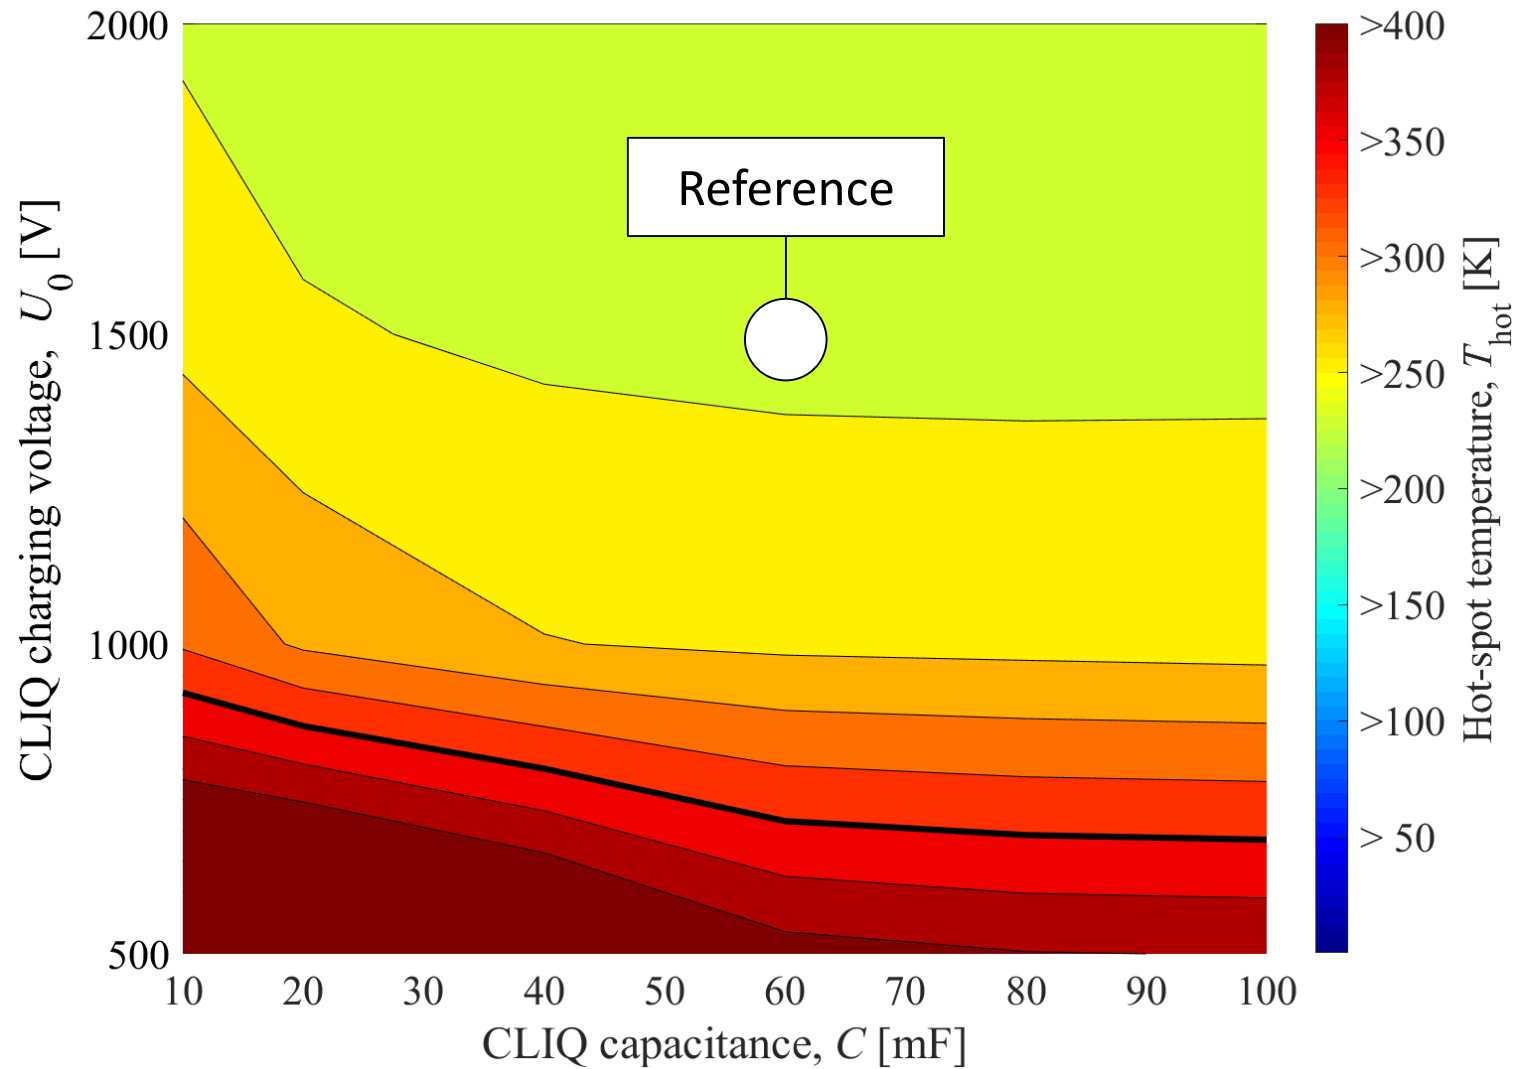

eRMC – Quench protection at I_{nom} – Effect of CLIQ capacitance **C**

In first approximation:

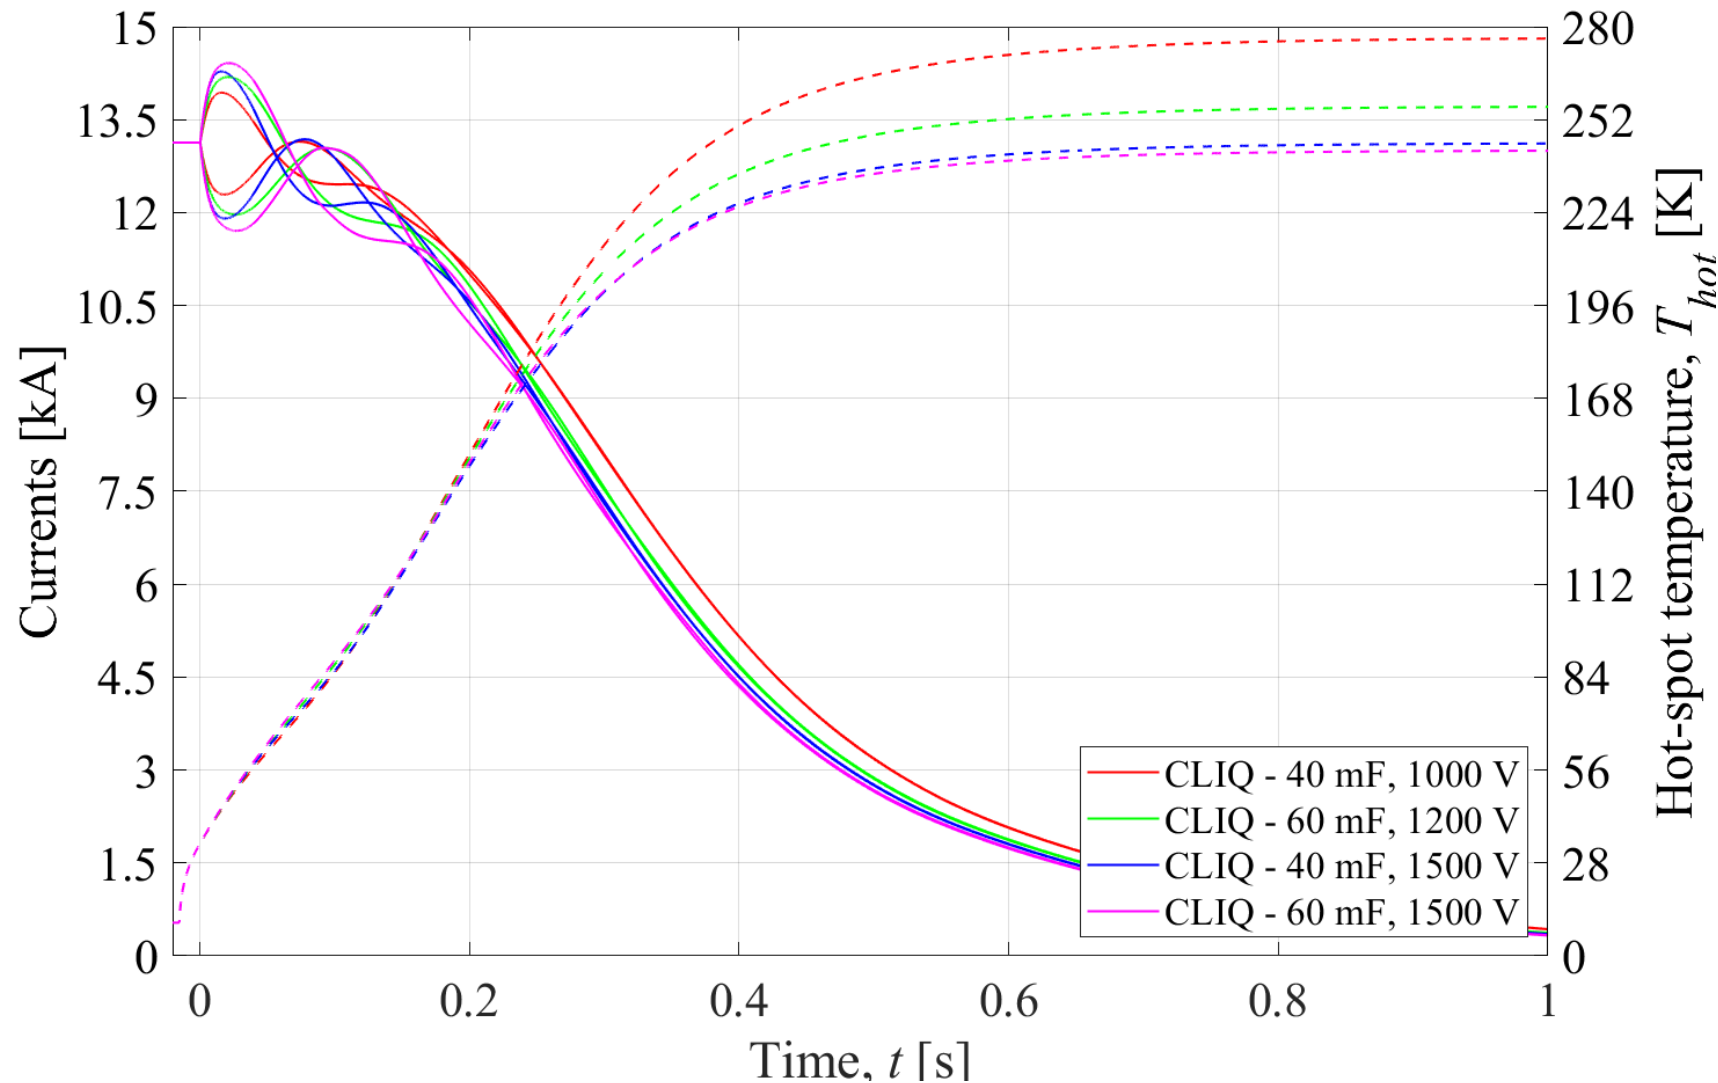

Peak current	$\propto C^{0.5}$
Current rate	\sim
Power	\sim
Energy	$\propto C$
Frequency	$\propto 1/C^{0.5}$

eRMC – Quench protection at I_{nom} – Effect of U_0 and C

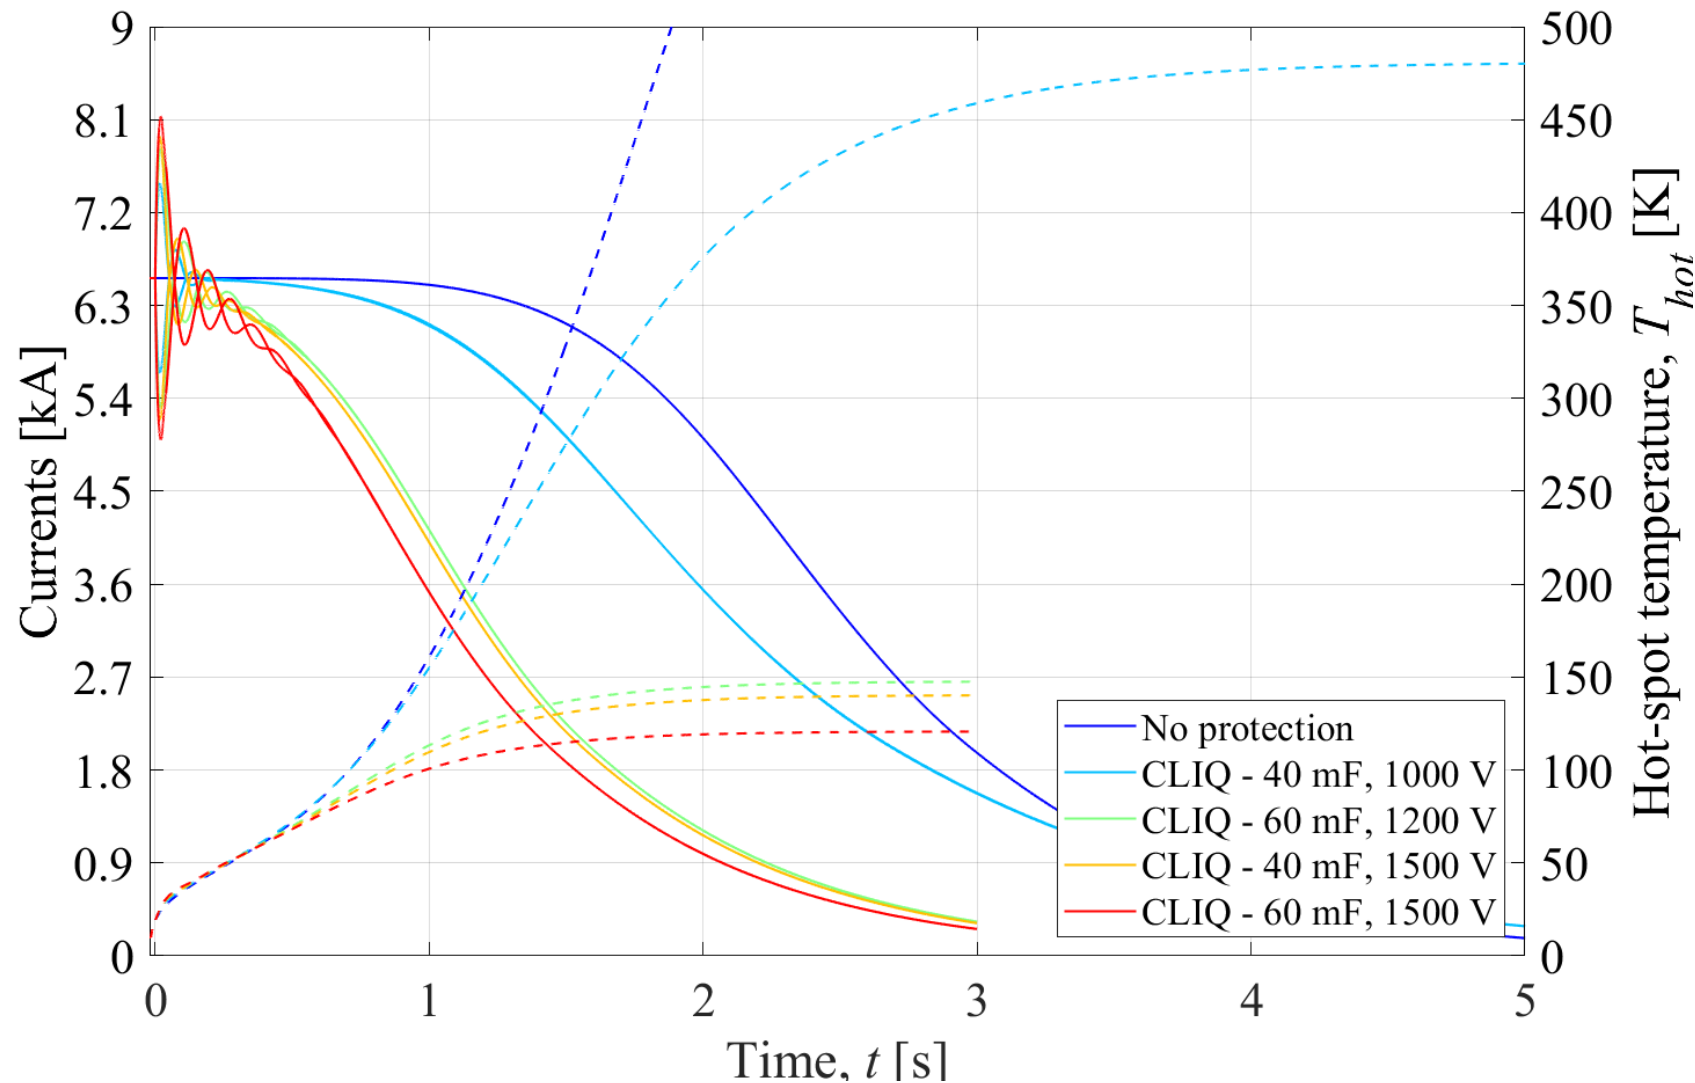

Selected configuration
 $C=60$ mF $U_0=1.5$ kV

eRMC – Quench protection at $I=I_{\text{nom}}=13.13$ kA

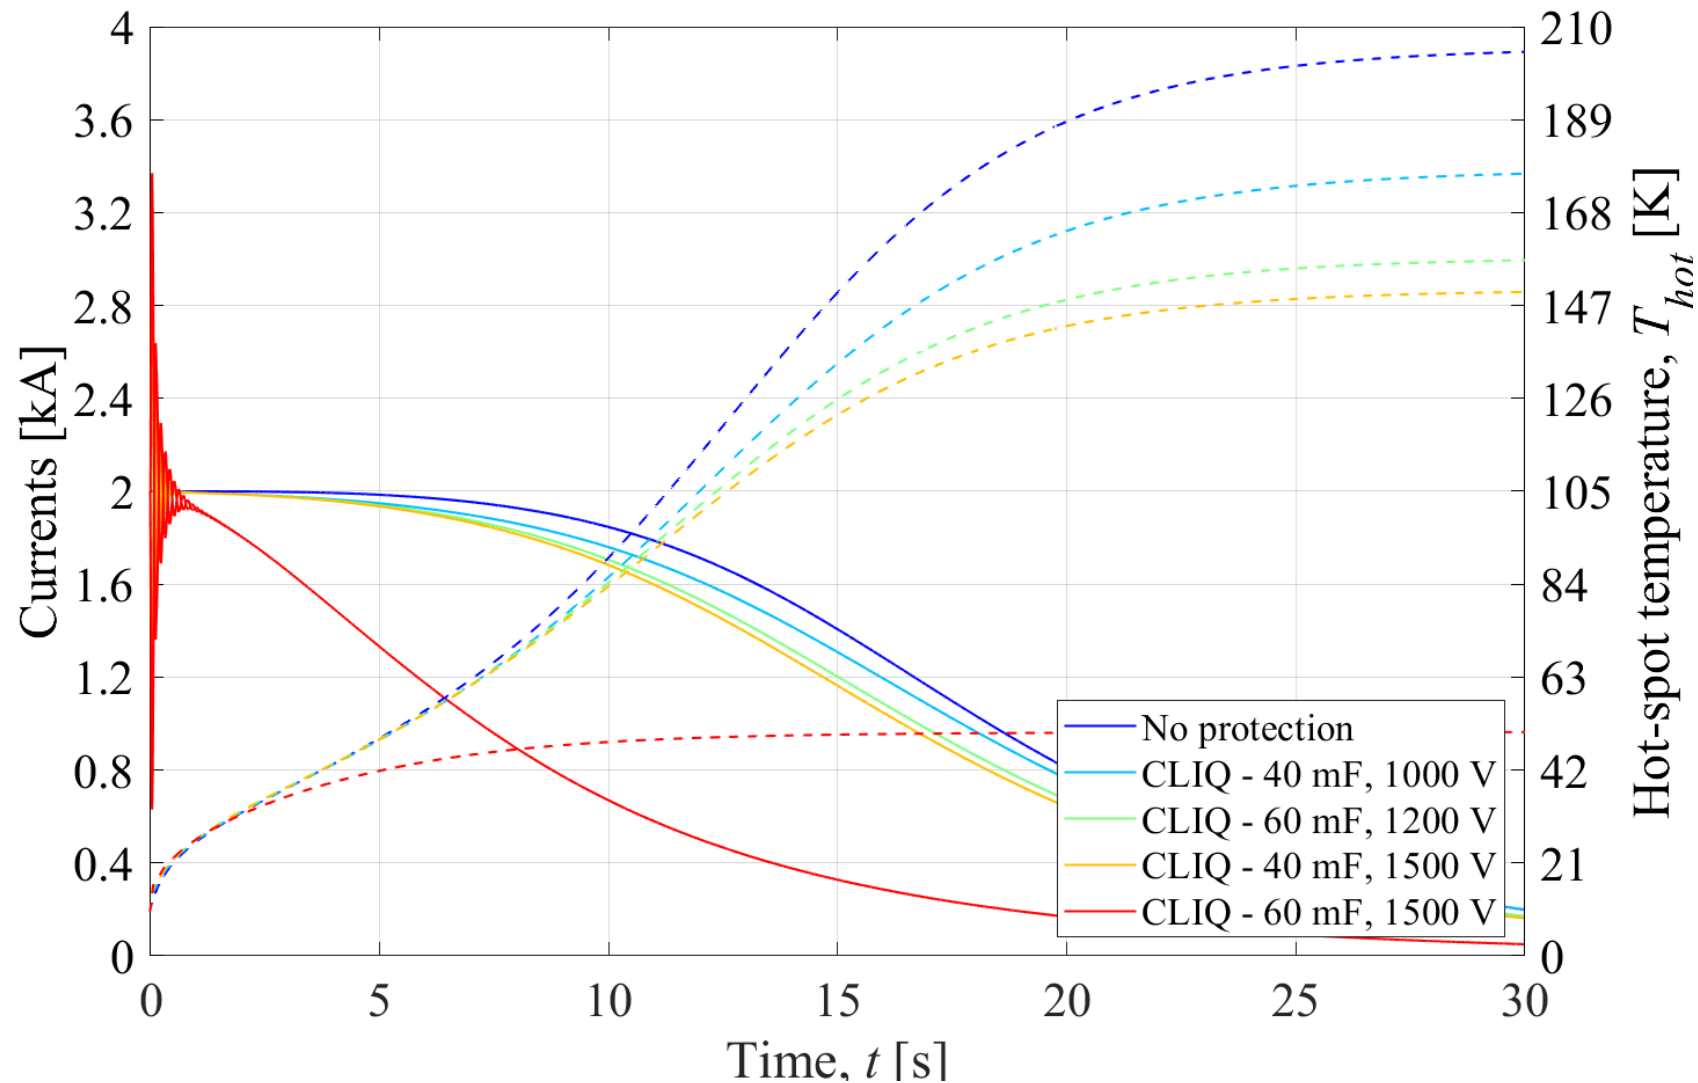

At nominal current,
hot-spot temperature
maintained in a
comfortable range of
250 to 300 K

eRMC – Quench protection at $I=50\% I_{\text{nom}}=6.56 \text{ kA}$

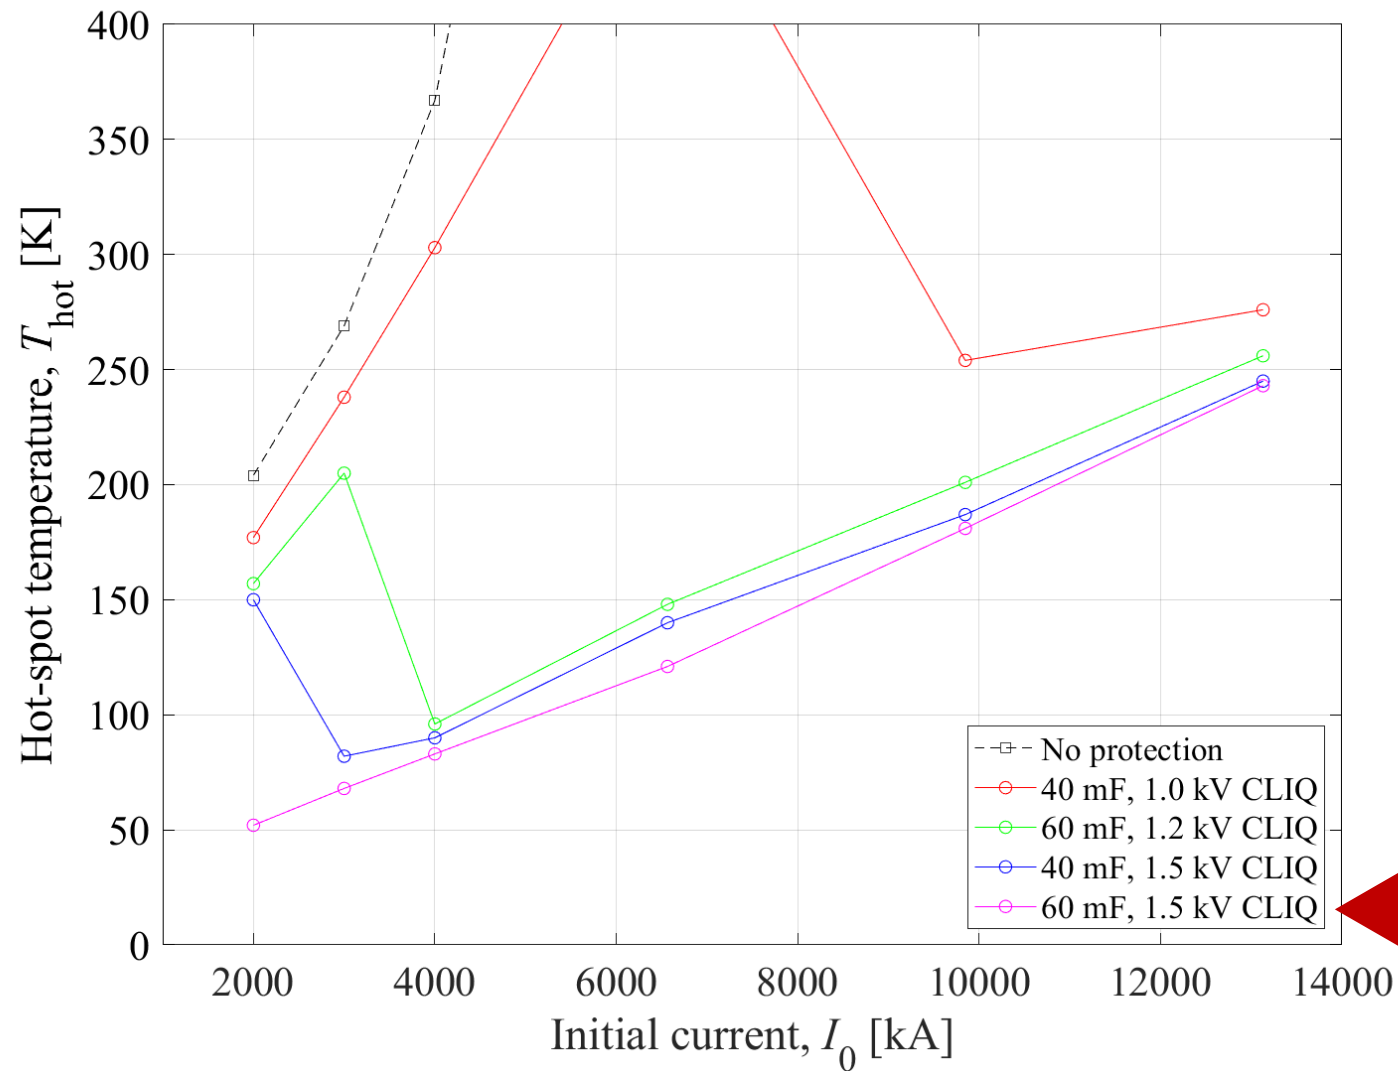

At mid-range current, **sufficient energy to quench** large coil sections must be provided (**C↑**)

eRMC – Quench protection at $I=2$ kA

At low current,
even more energy
must be provided (**C**↑)

eRMC – Quench protection summary

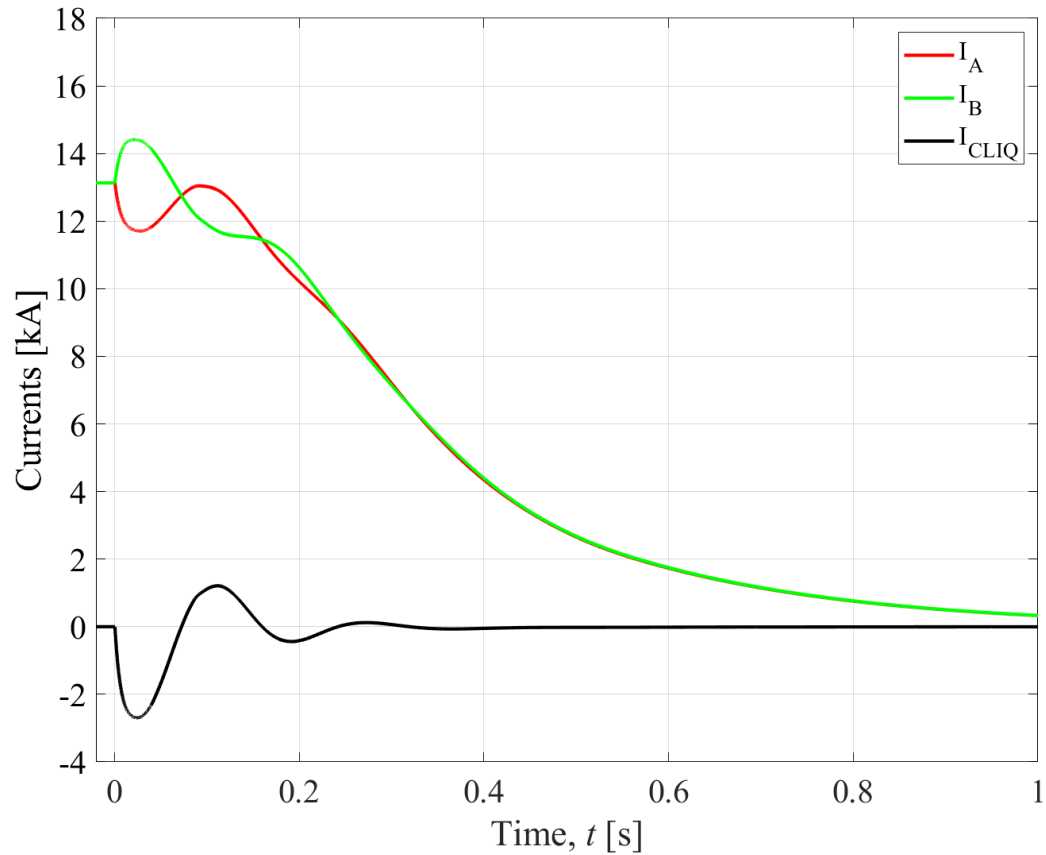

Selected configuration
C=60 mF $U_0=1.5$ kV

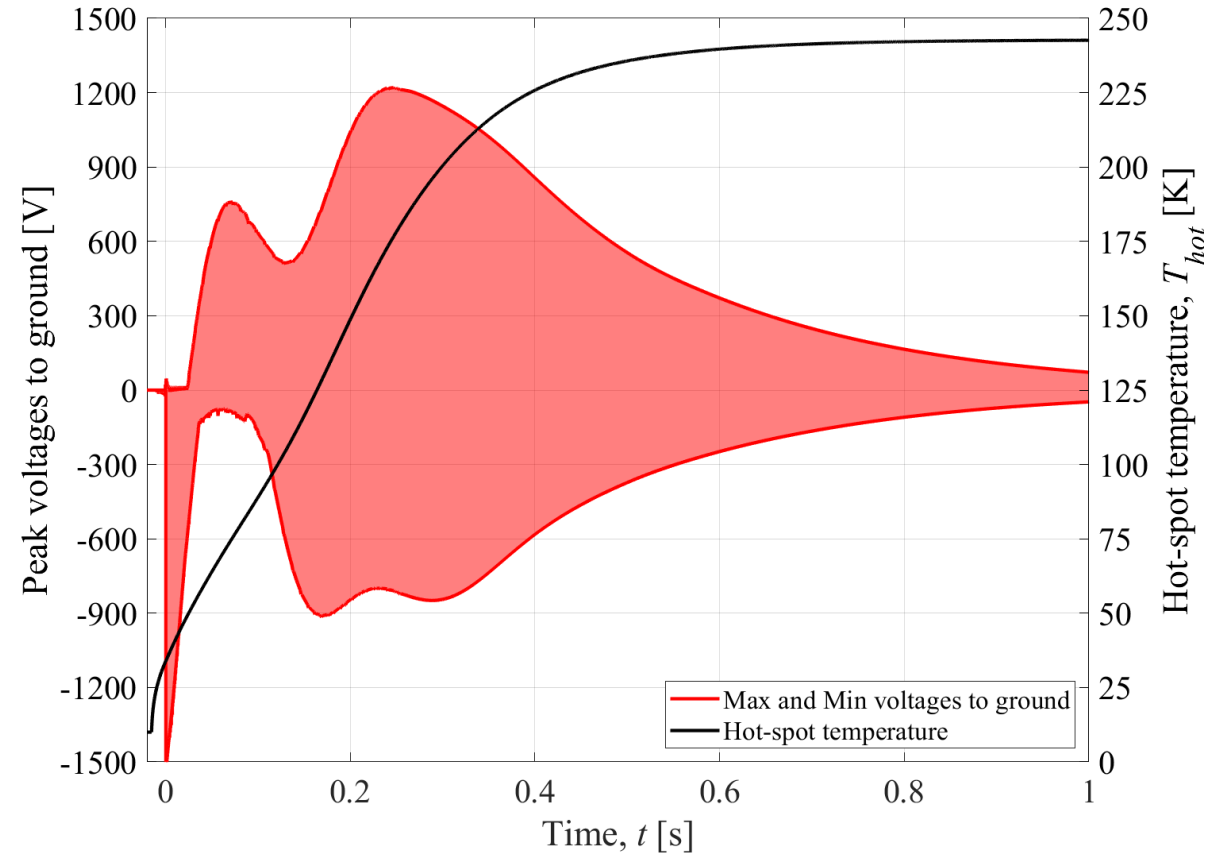

Induces quench
at all current levels

eRMC – Quench protection at I_{nom} – Reference quench protection

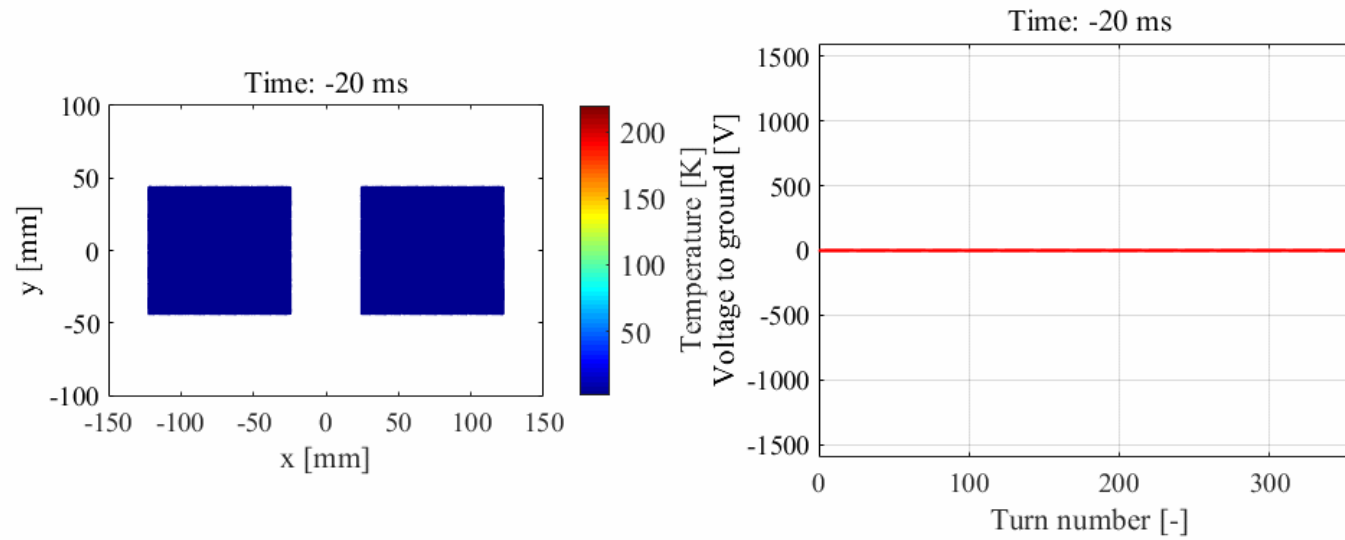

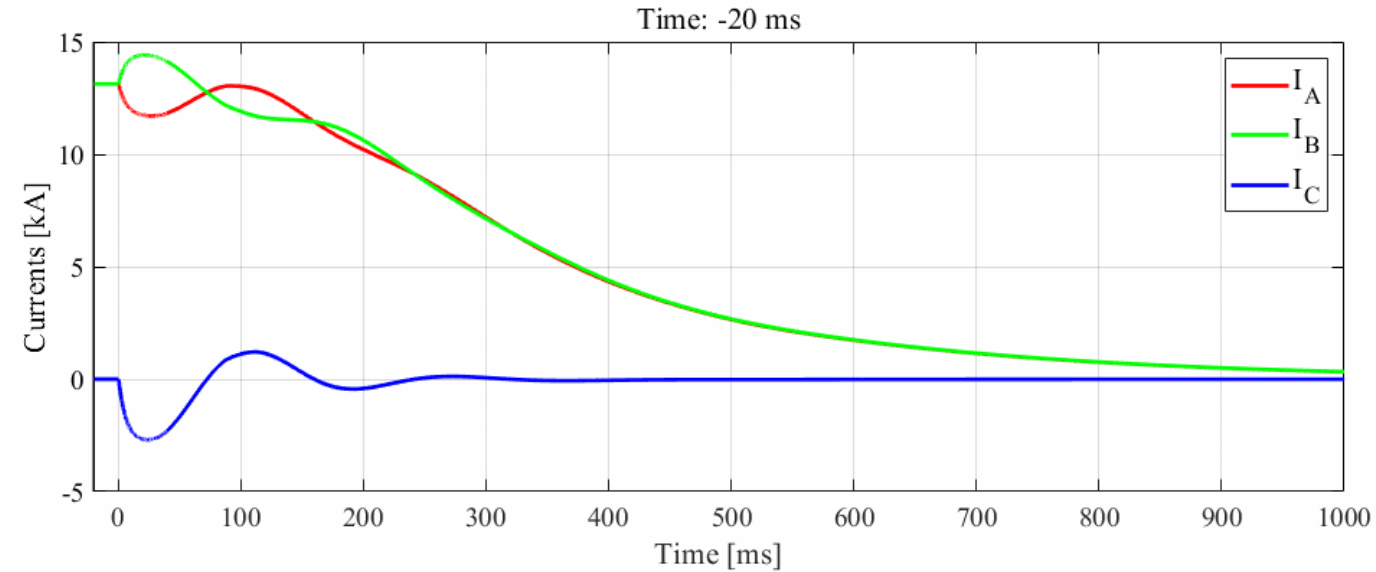

Currents in the system

Voltage to ground distribution and hot-spot temperature

eRMC – Quench protection at I_{nom} – Reference quench protection

Power	$\propto U_0^2$
Energy	$\propto U_0^2$
Frequency	\sim

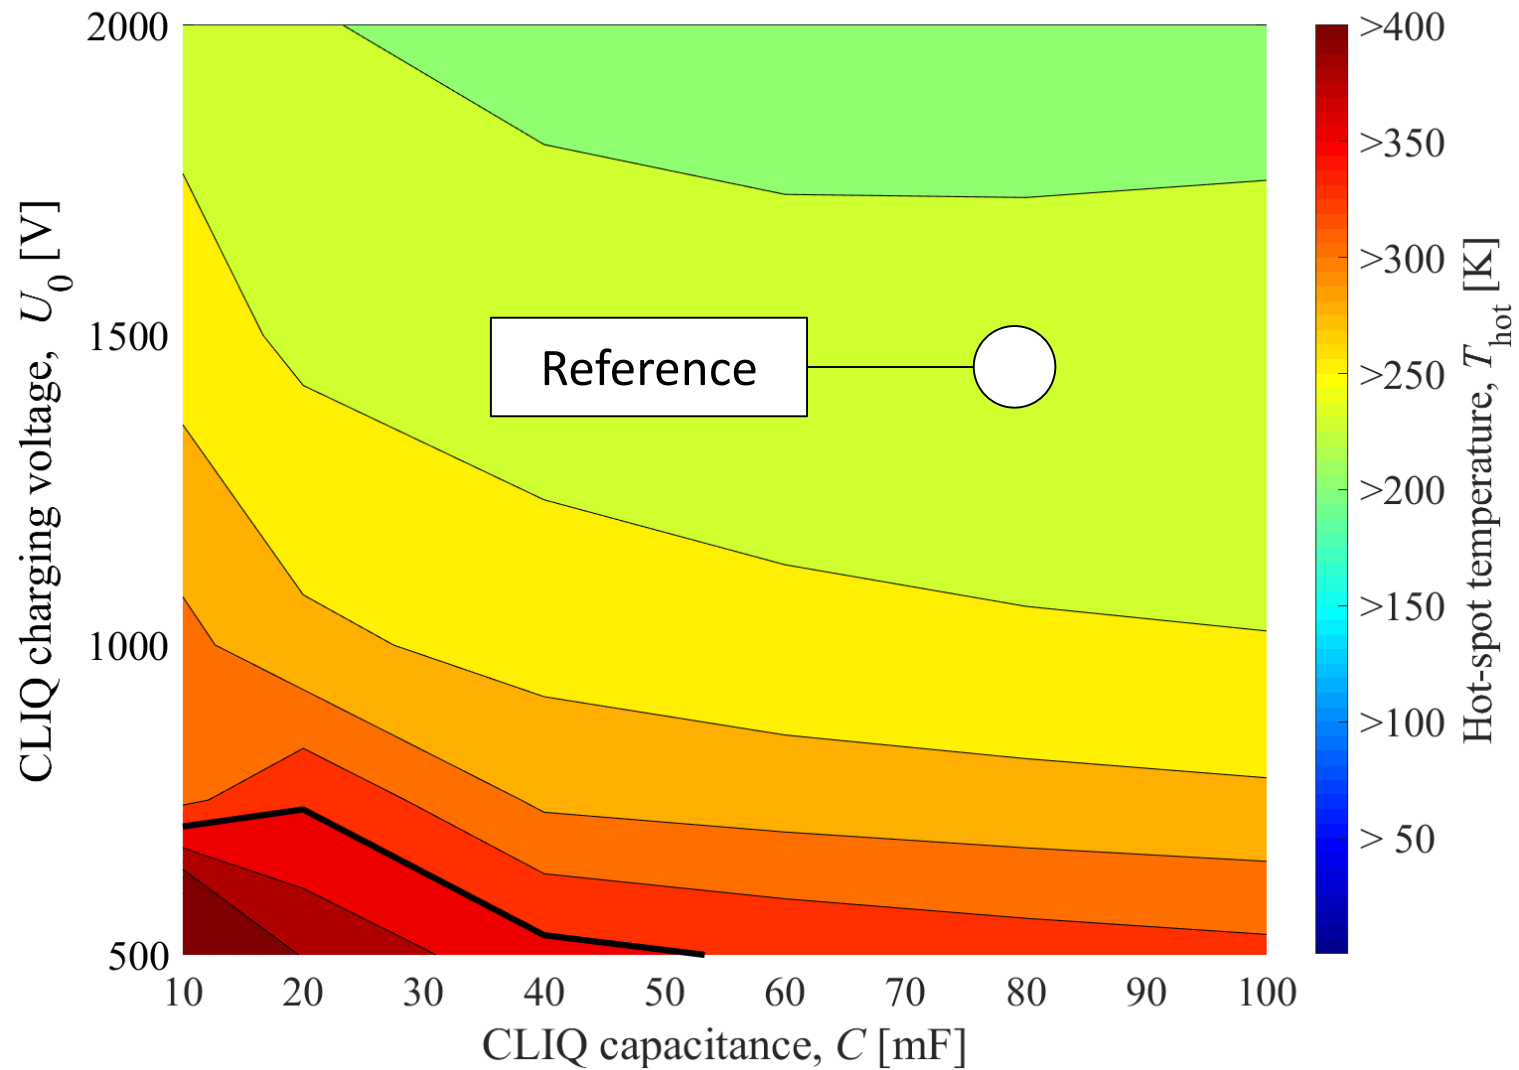

RMM – Quench protection at I_{nom} – Effect of CLIQ capacitance **C**

In first approximation:

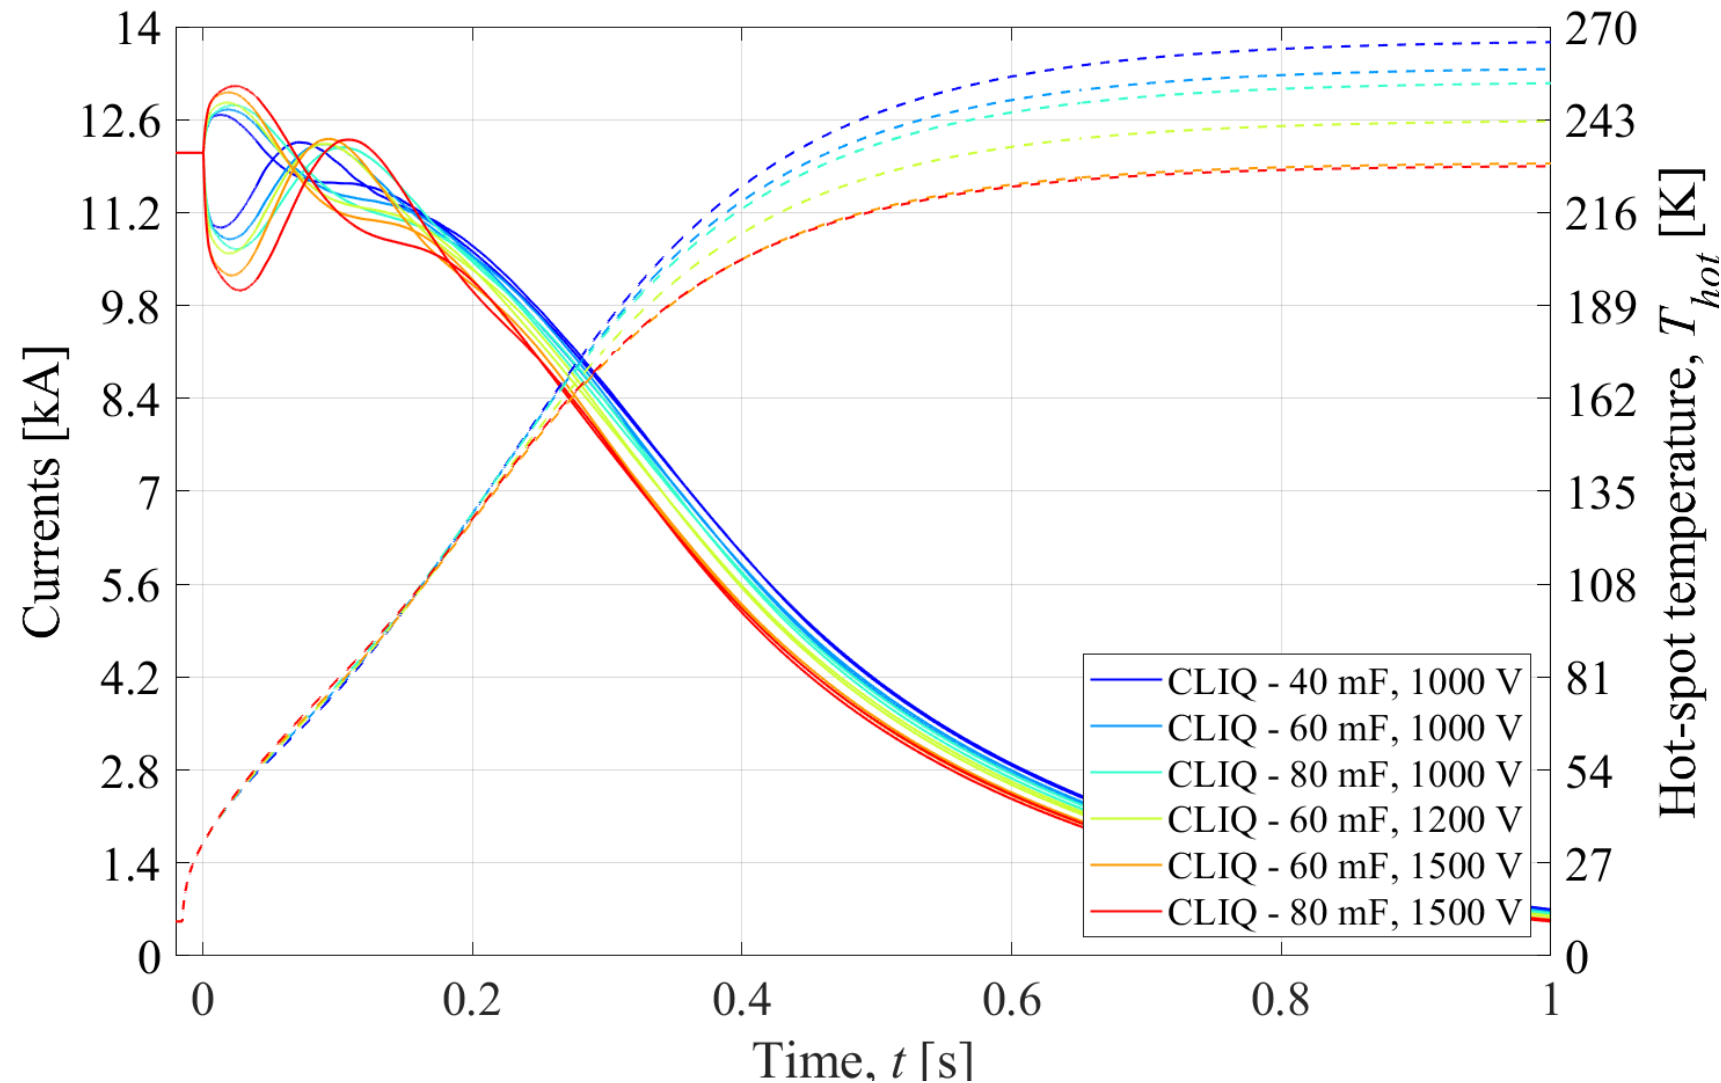

Peak current	$\propto C^{0.5}$
Current rate	\sim
Power	\sim
Energy	$\propto C$
Frequency	$\propto 1/C^{0.5}$

RMM – Quench protection at I_{nom} – Effect of U_0 and C

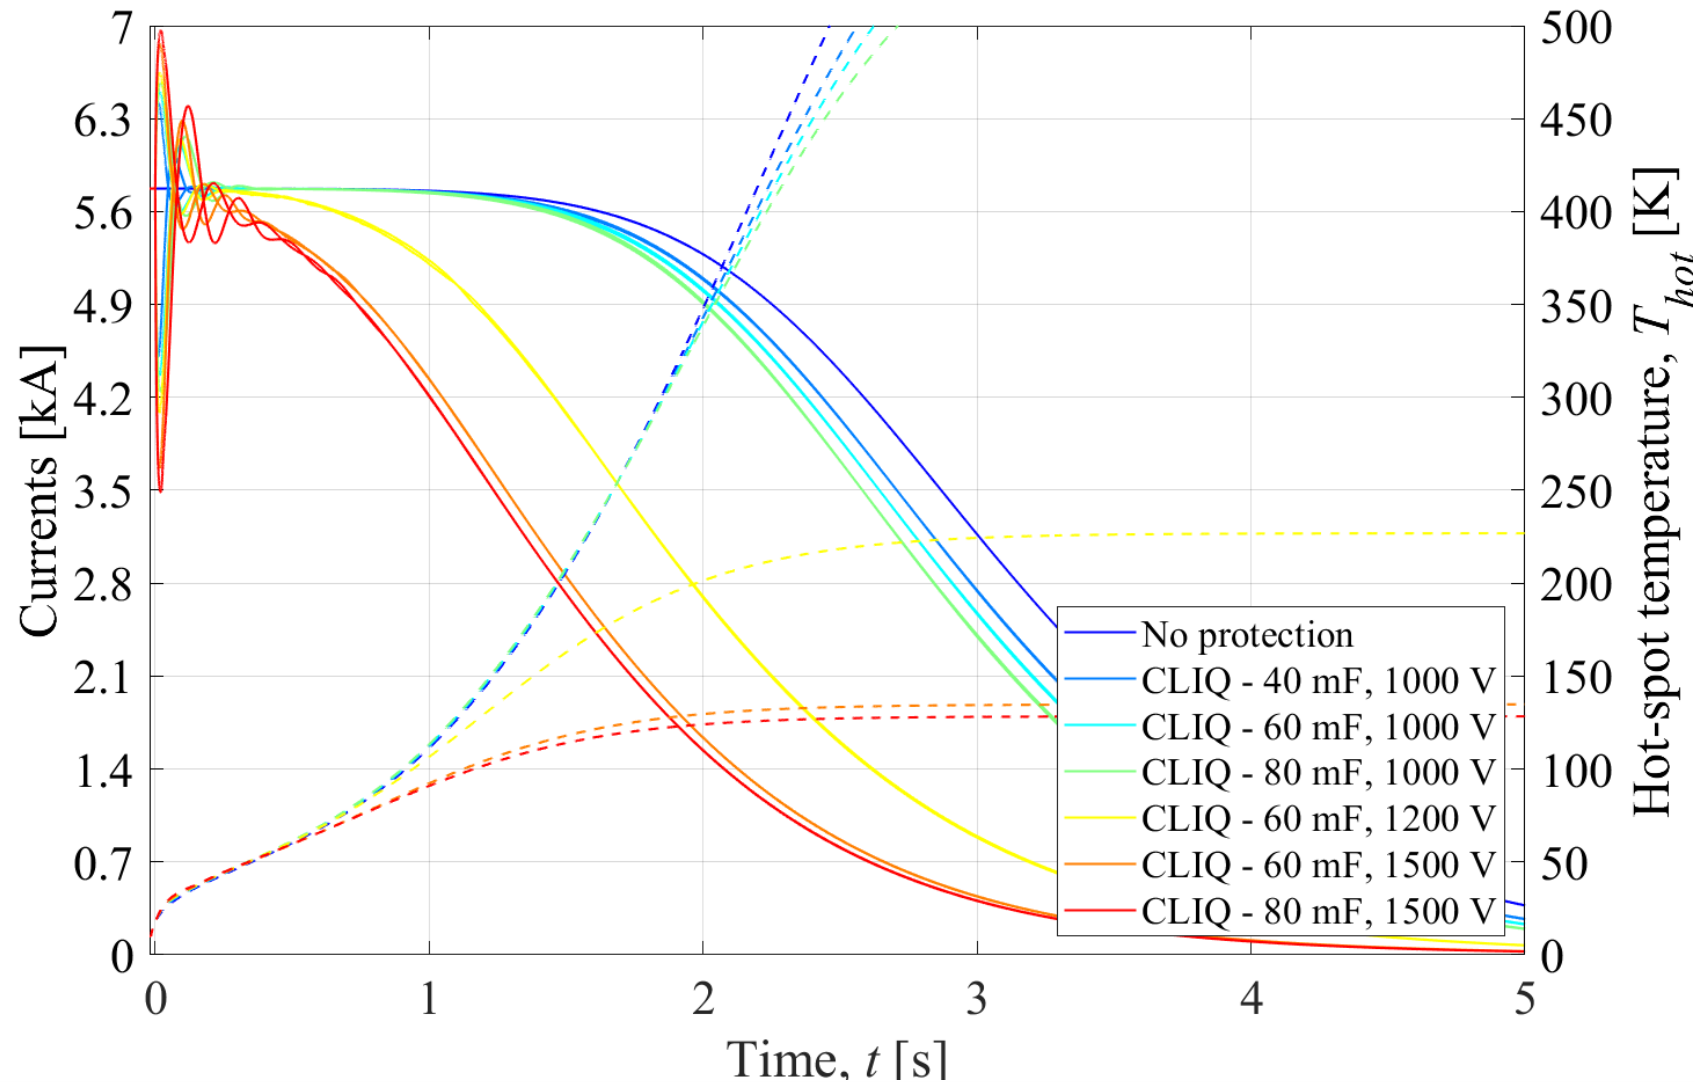

Selected configuration
 $C=80$ mF $U_0=1.5$ kV

RMM – Quench protection at $I=I_{\text{nom}}=12.1$ kA

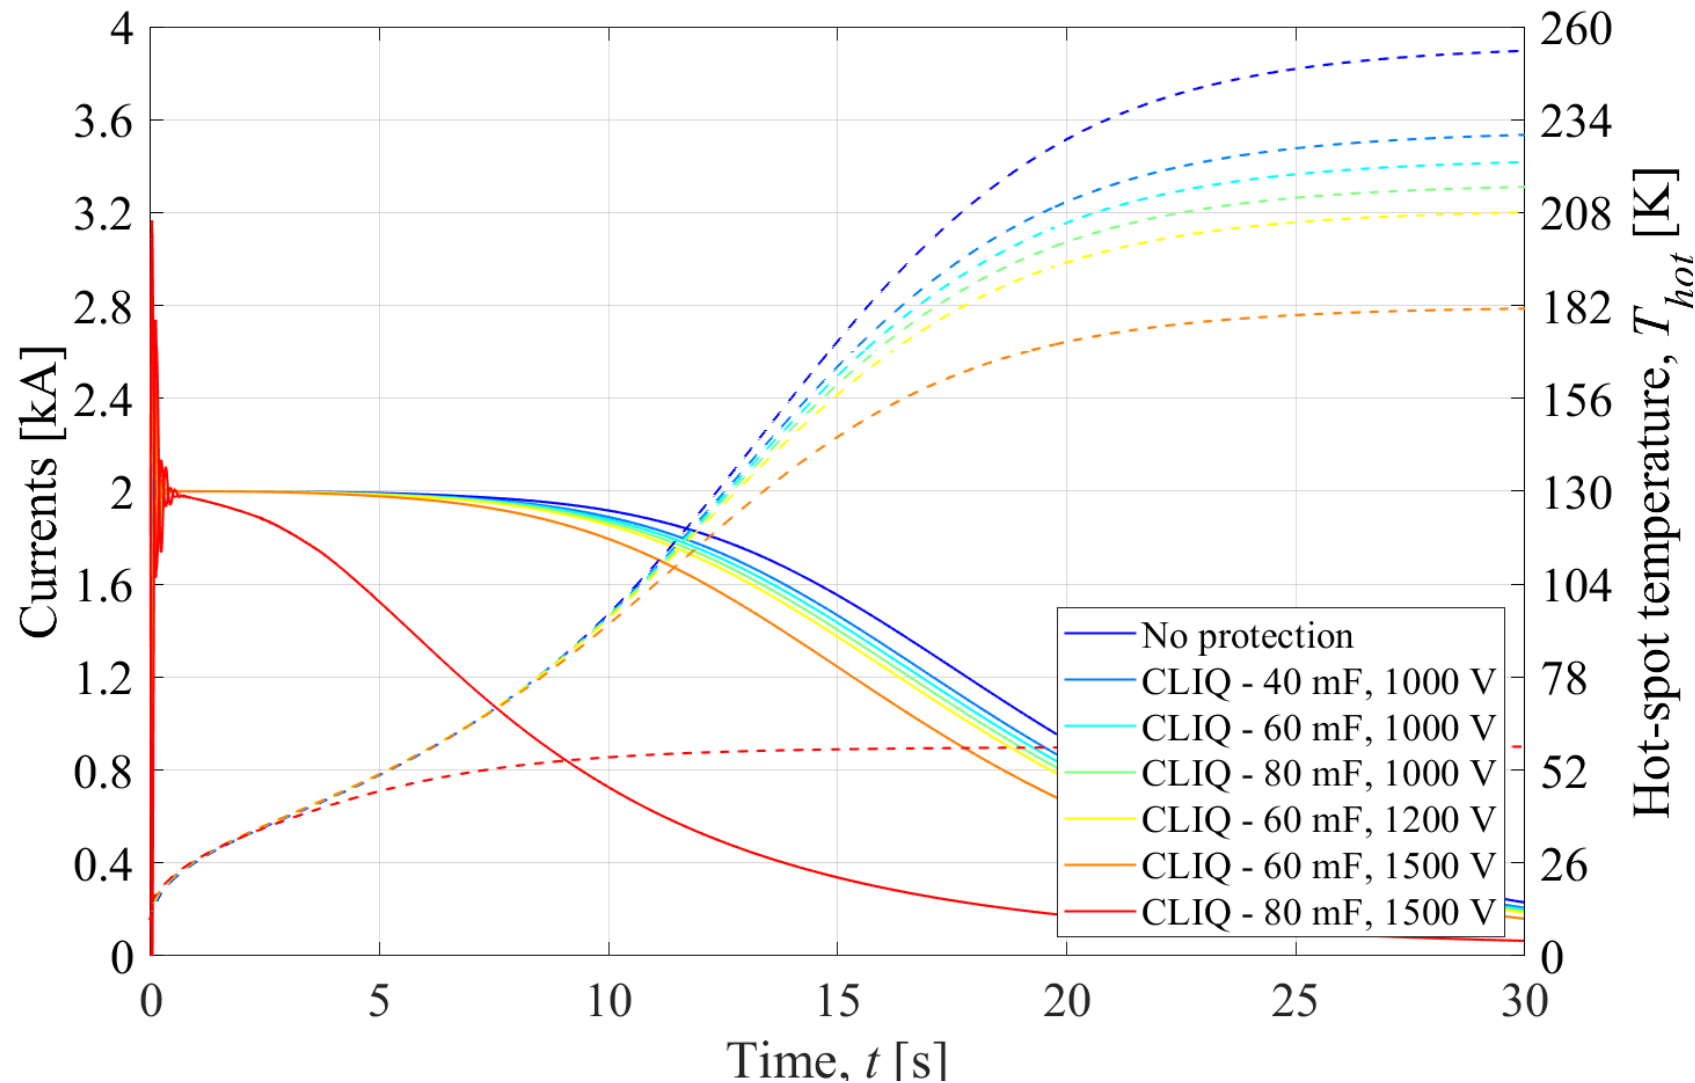

At nominal current, hot-spot temperature maintained in a comfortable range of **250 to 300 K**

RMM – Quench protection at $I=50\% I_{\text{nom}}=5.77 \text{ kA}$

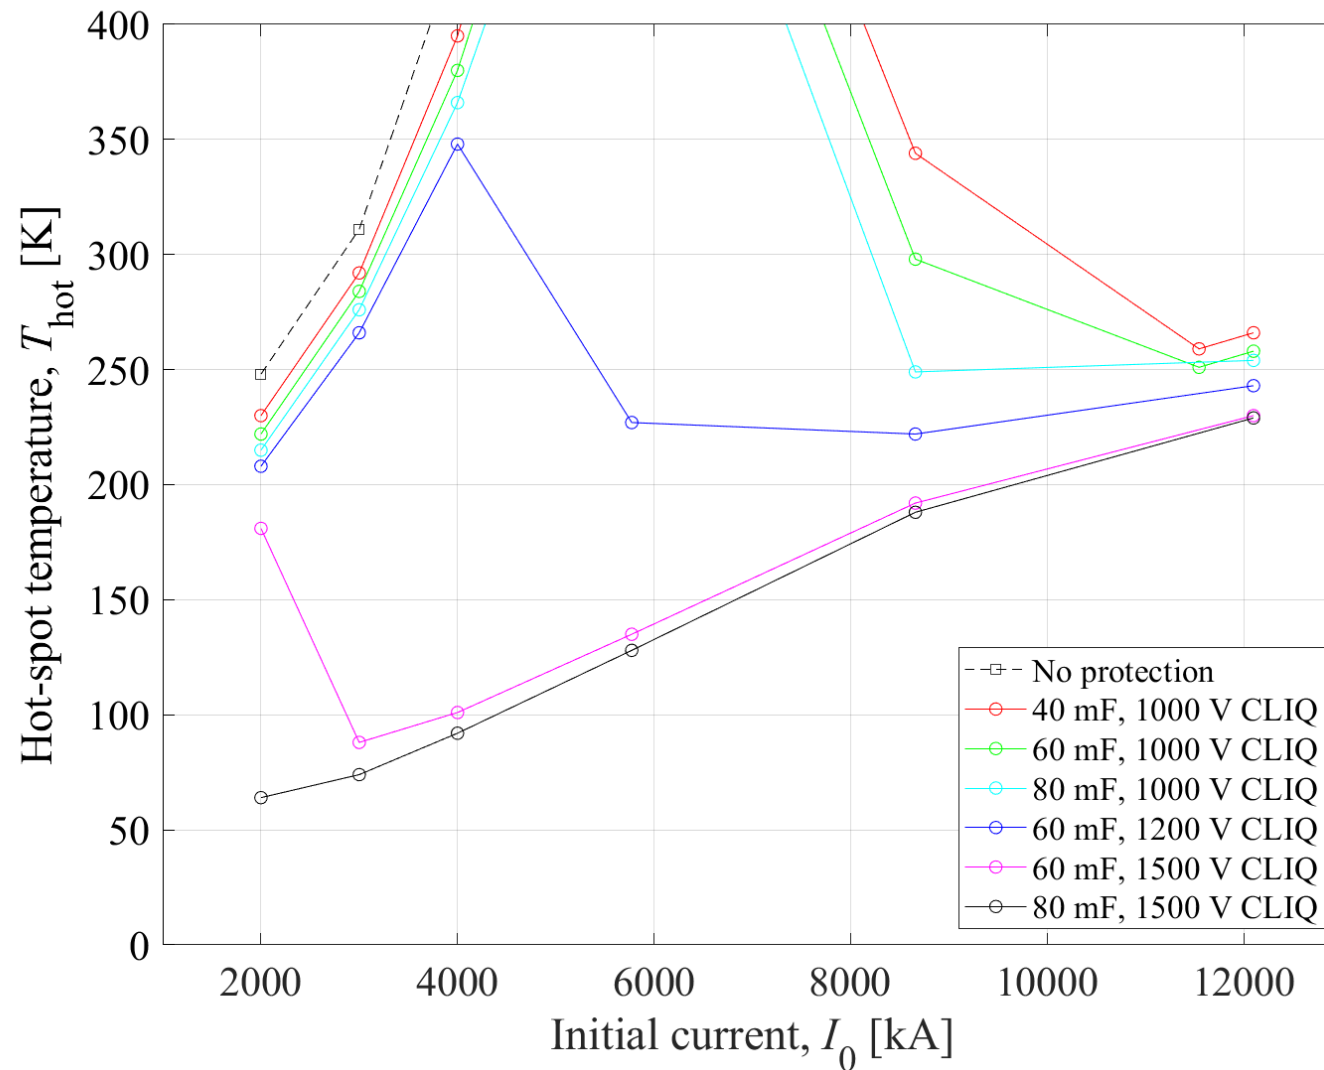

At mid-range current, **sufficient energy to quench** large coil sections must be provided (**C↑**)

RMM – Quench protection at I=2 kA

At low current,
even more energy
must be provided (**C**↑)

RMM – Quench protection summary

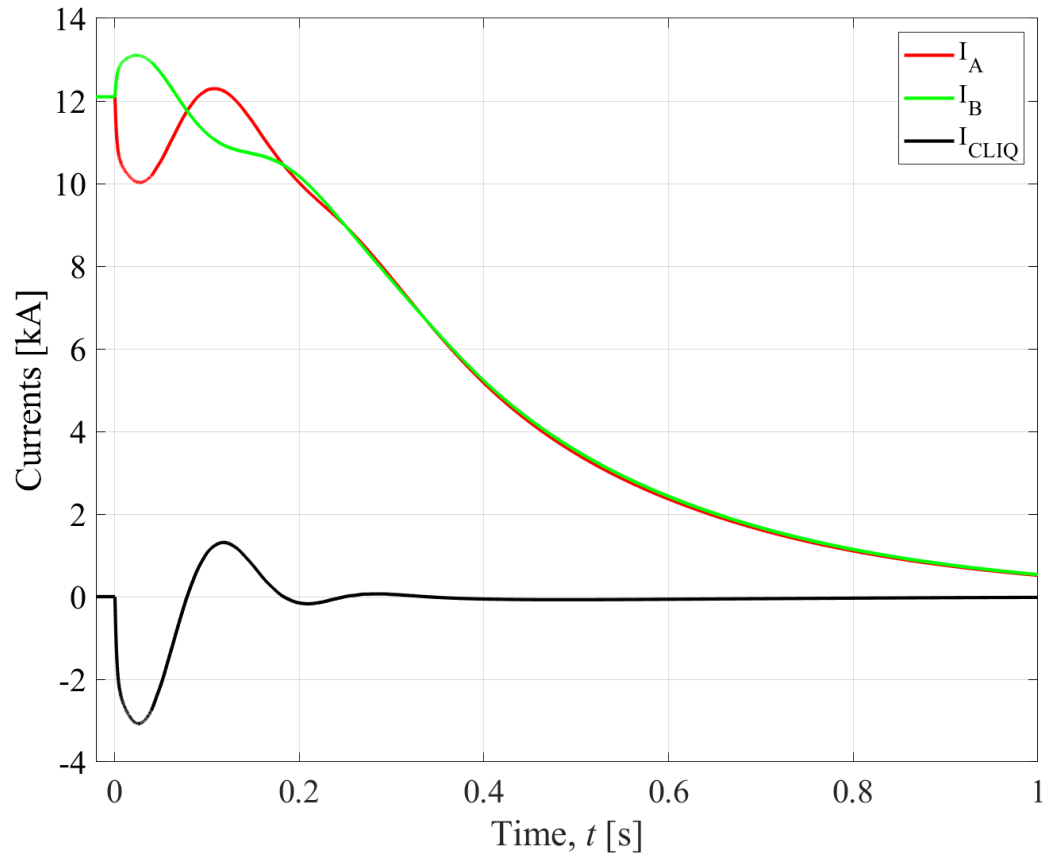

Selected configuration
C=80 mF $U_0=1.5$ kV

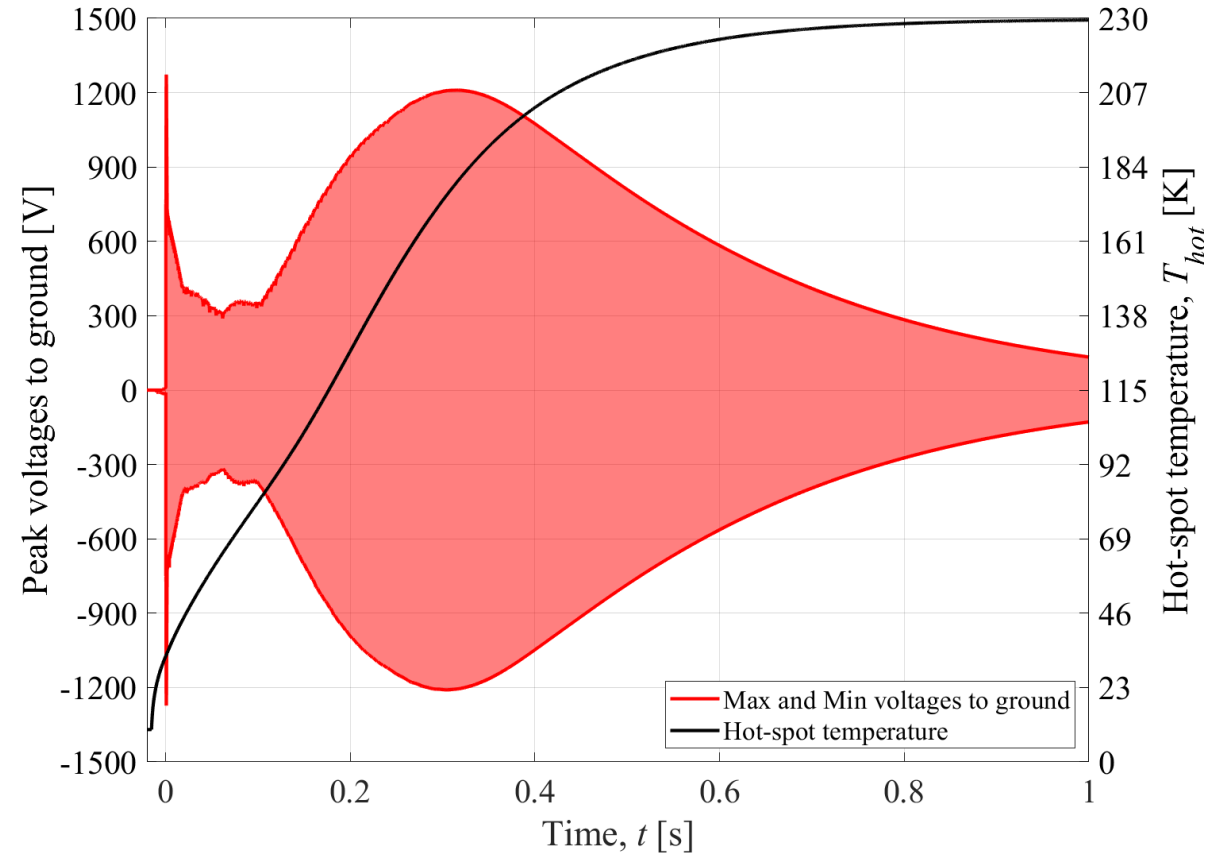

Induces quench
at all current levels

RMM – Quench protection at I_{nom} – Reference

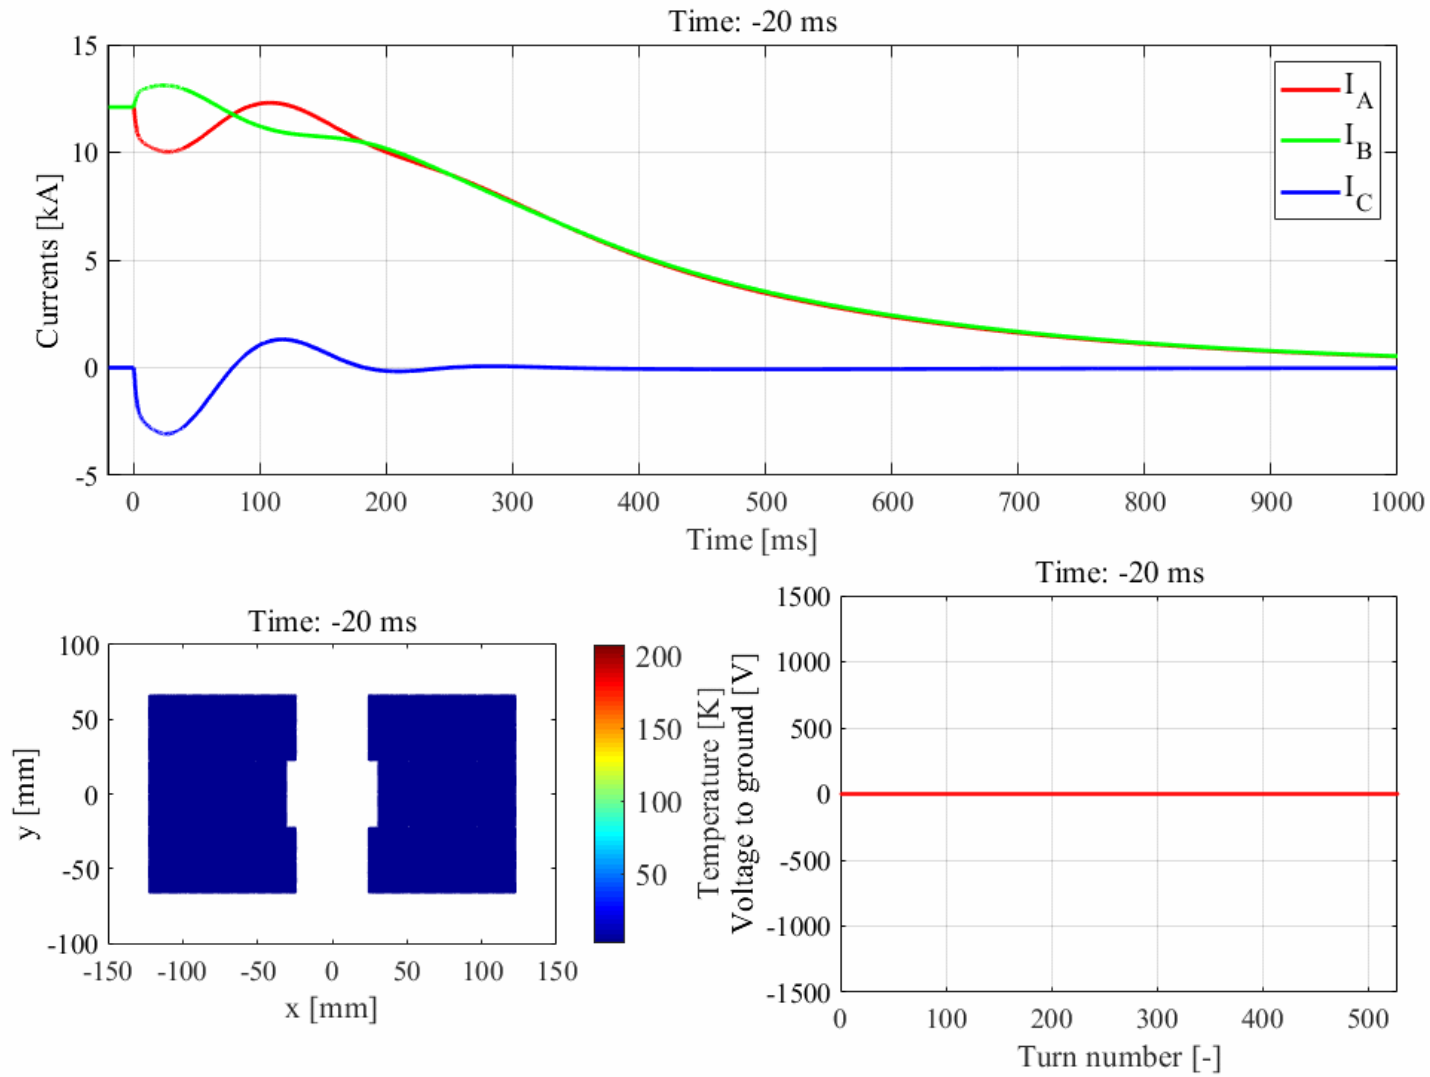

Currents in the system

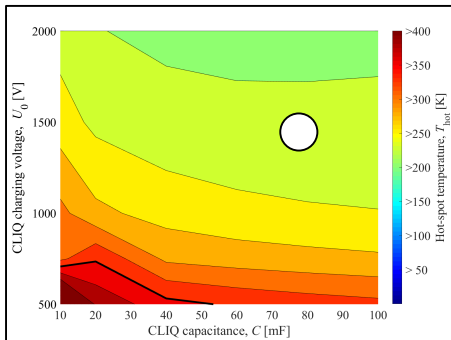

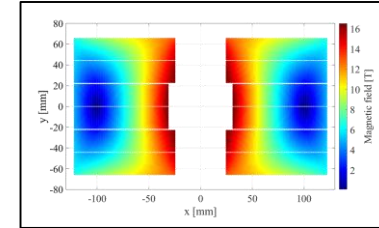

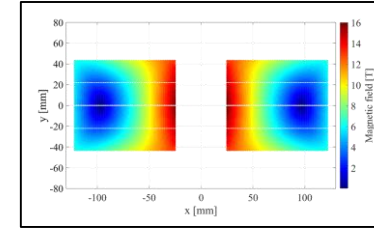

Voltage to ground distribution and hot-spot temperature

RMM – Quench protection at I_{nom} – Reference

Conclusion

Quench protection of two **16 T Nb₃Sn** dipole magnets analyzed
→ All simulations performed with **STEAM-LEDET**

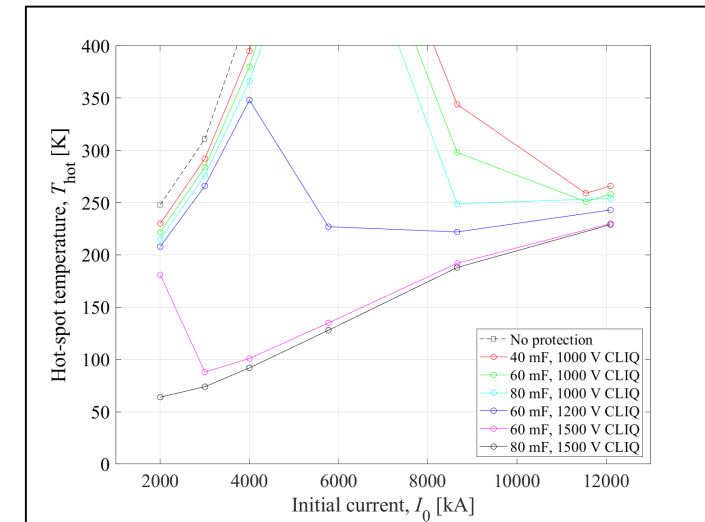

Proposed solution is based on **CLIQ** (Coupling-Loss Induced Quench)
→ CLIQ **connection optimized** for both magnets
→ CLIQ **unit capacitance** and **charging voltage** selected for both magnets
→ Solution will be **tested** in the coming month on a short magnet

With the proposed quench protection system

- Hot-spot temperature **<250 K** at nominal current
- Peak voltage to ground **<1500 V** at nominal current
- Magnets protected **at all current levels**, with margin

Don't forget to analyze the mid-current range!...
