Enterasys - Networks that Know

Wednesday, 29 September 2004 11:30 (30 minutes)

Today and in the future businesses need an intelligent network. And Enterasys has the smarter solution. Our active network uses a combination of context-based and embedded security technologies - as well as the industry's first automated response capability - so it can manage who is using your network. Our solution also protects the entire enterprise - from the edge, through the distribution layer, and into the core of the network. Threats are recognized and isolated at the user level, rather than taking your entire network down. It even has the ability to coexist with and enhance your legacy data networking infrastructure and existing security appliances - regardless of the vendor. By continually offering a context-based analysis of network traffic, our solution allows you to see not only what the problem is, but also where it is, and who caused it. And, with the industry's most advanced controls, we're the first solution that's able to resolve threats across the entire network - dynamically or on demand.
