

# Muon system's studies

## Muon reconstruction update

C. Aimè, C. Riccardi, P. Salvini, I. Vai

# BIB & gun signal:

## TO DO LIST

- Try gun+BIB
- Check results with the new version of the software & geometry

# Muon reconstruction:

## TO DO LIST

- Check matching
- Parameters tuning
- Study detector performances with:
  - Physics channel
  - Physics channel + BIB

## New version of software & geometry

ISSUE with Cmake during installation → incompatible version

- Not easily detectable (we had it when we compiled our processor)
- Easily fixable – remove cmake before starting the installation

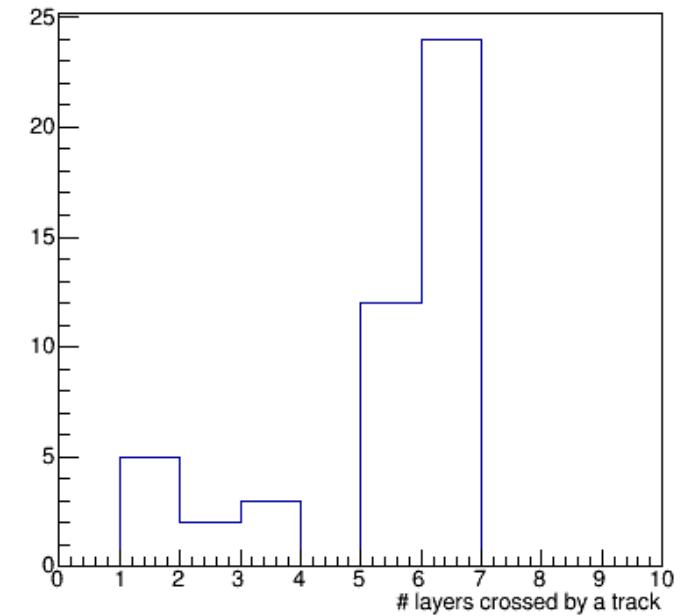

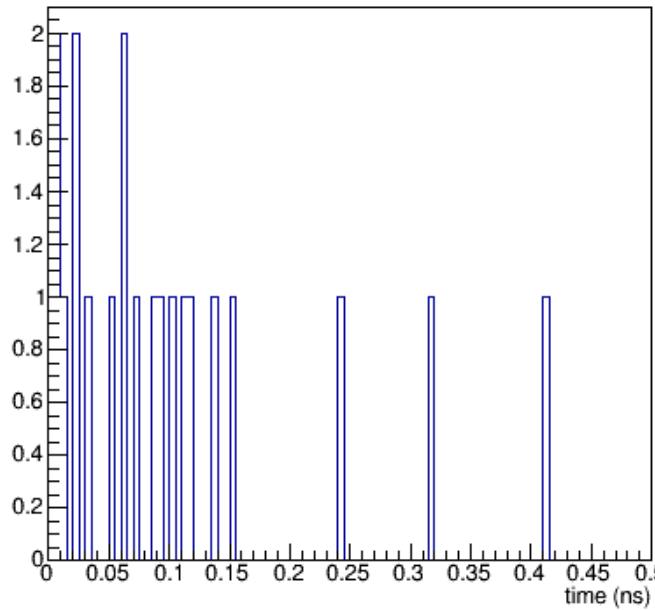

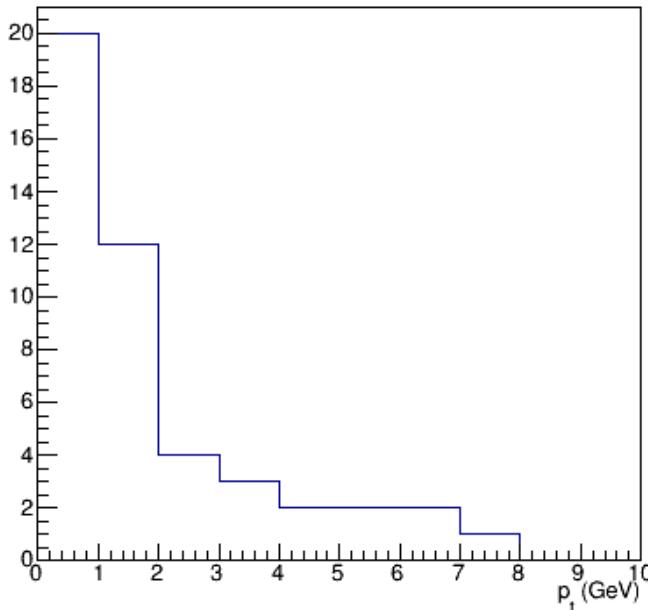

In the `reco_steer.xml` file (provided in the SoftCheck directory) the B field values are not updated

## Try BIB & gun

The Overlay takes a lot of time → we kept them separated

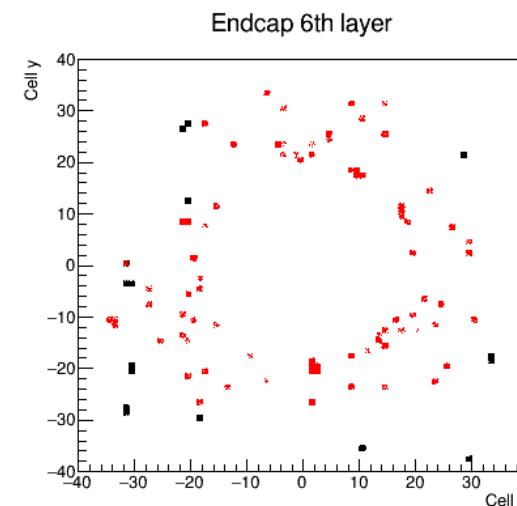

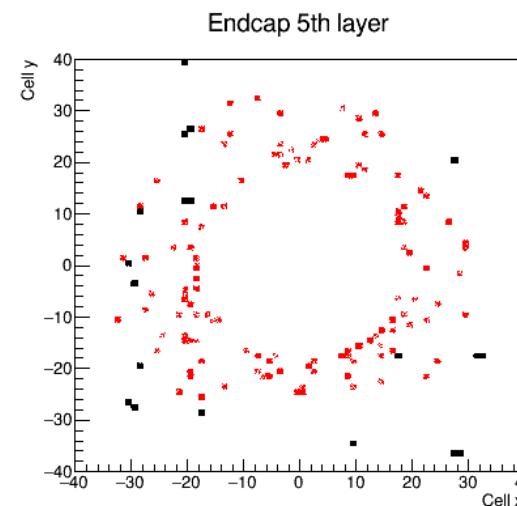

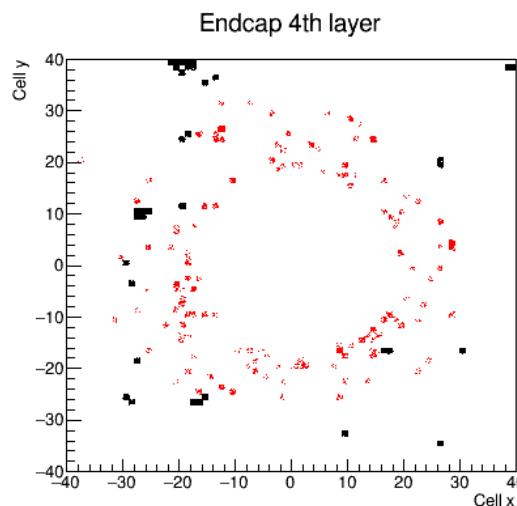

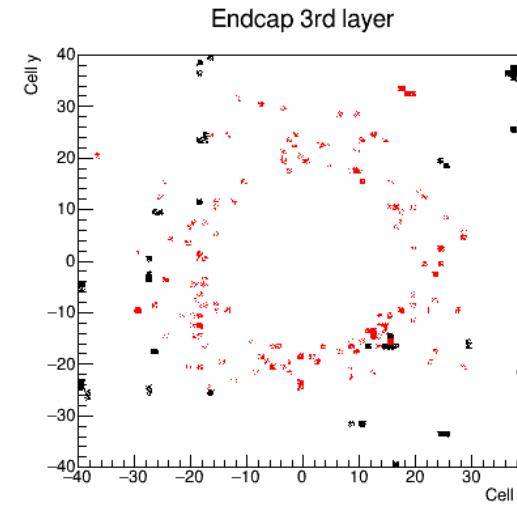

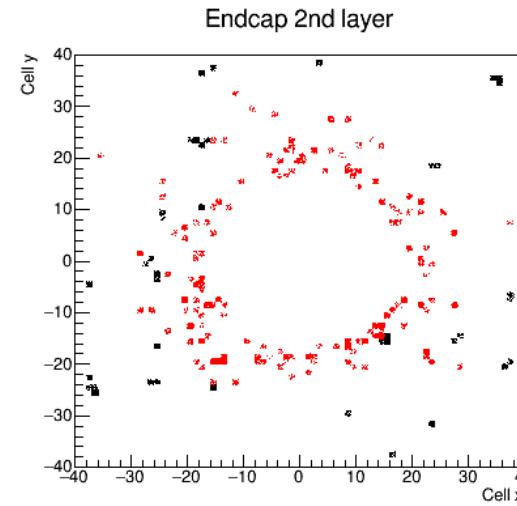

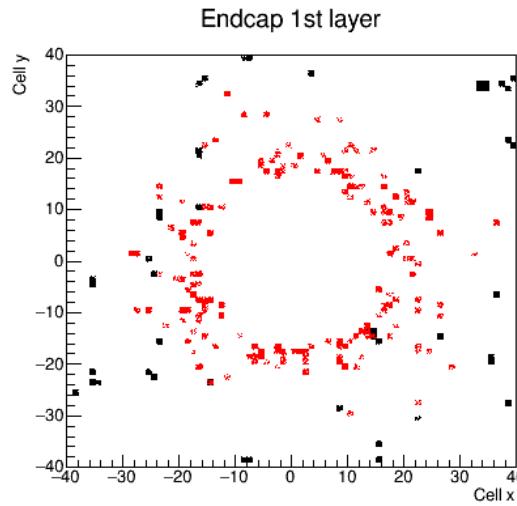

# BIB analysis

There are no tracks in the muon system barrel → cuts needed for the endcap

46 tracks per bunch crossing

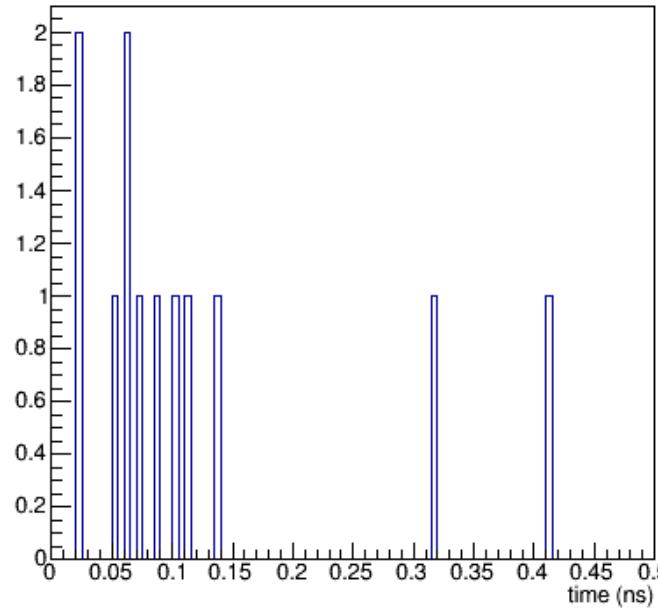

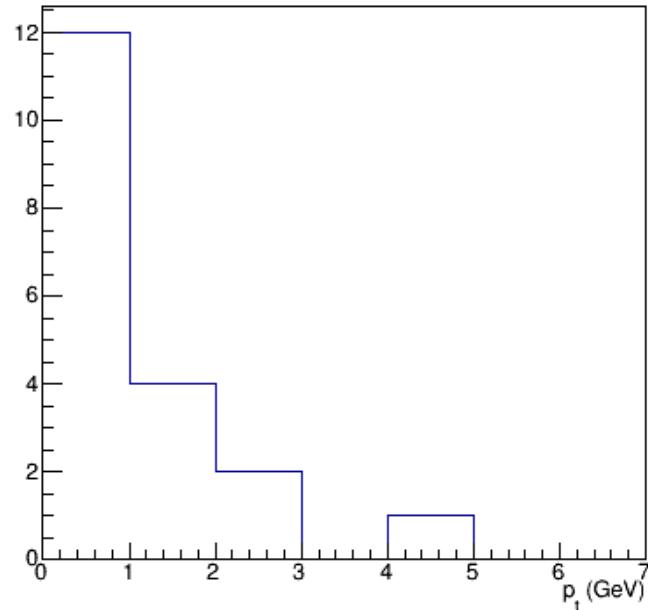

# BIB analysis

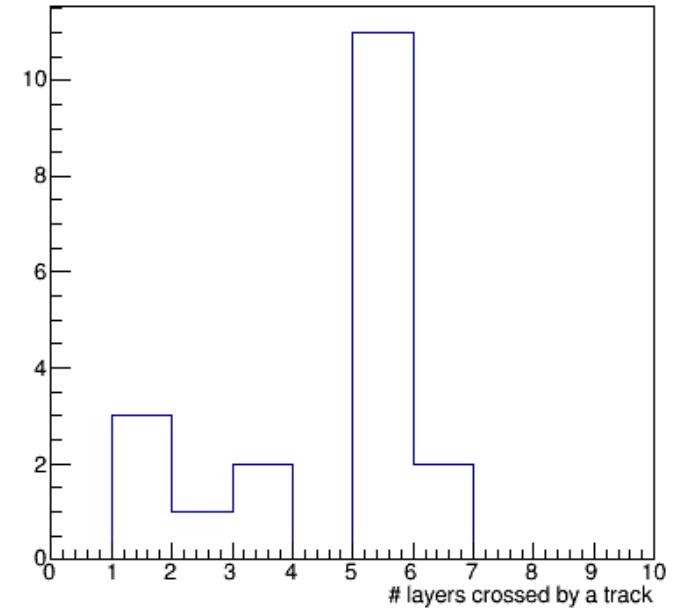

GEOMETRICAL CUT:  $8^\circ < \text{interesting region} < 172^\circ$

# BIB cut chosen

Geometrical cut +

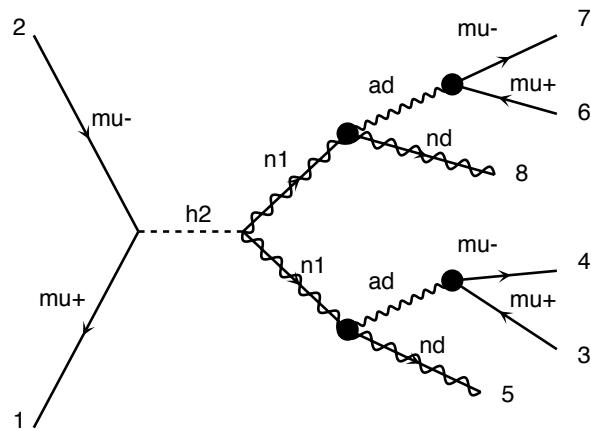

Still 19 tracks (~41%) per bunch crossing

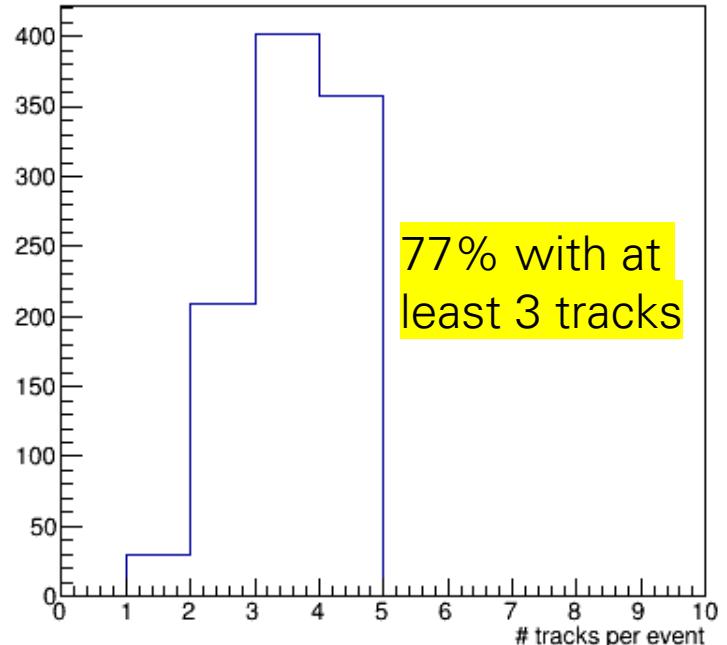

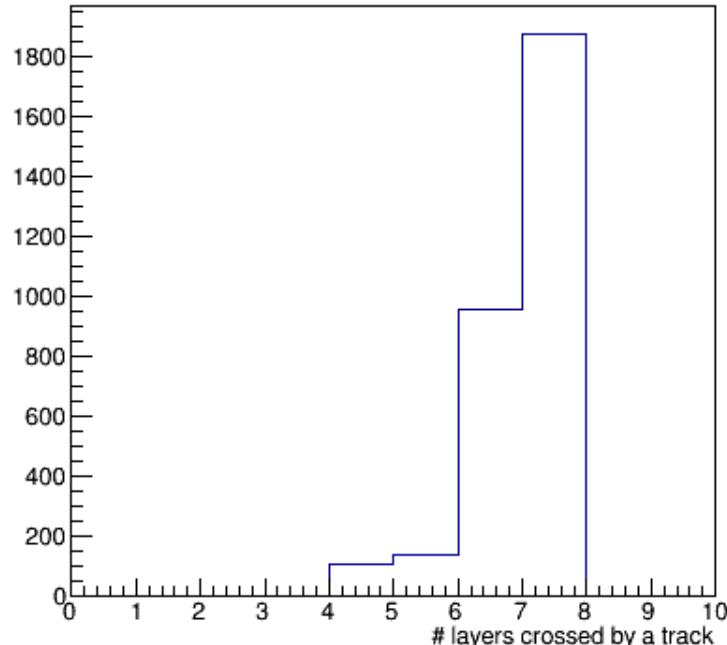

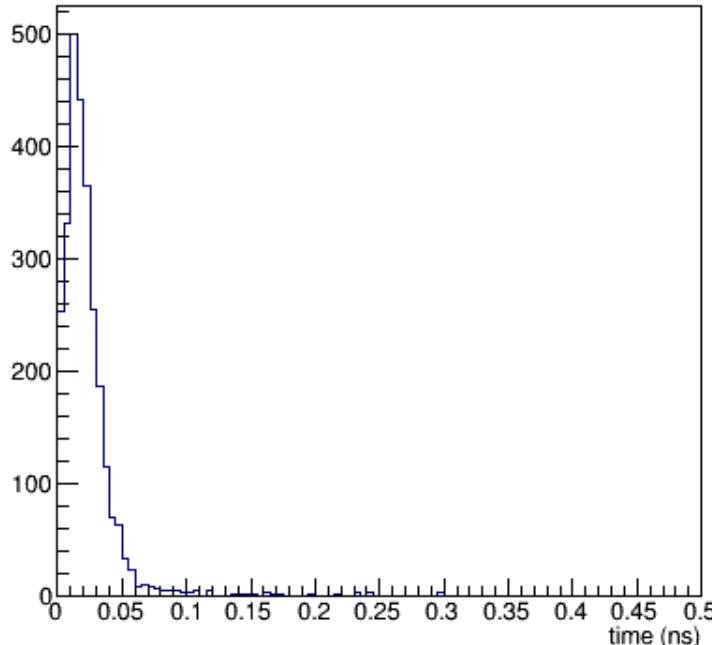

- $p_t > 5$  GeV
- $p_t > 3$  GeV & # layers crossed > 2
- ... possible time cut

→ No more BIB tracks in the muon system

# Physics channel

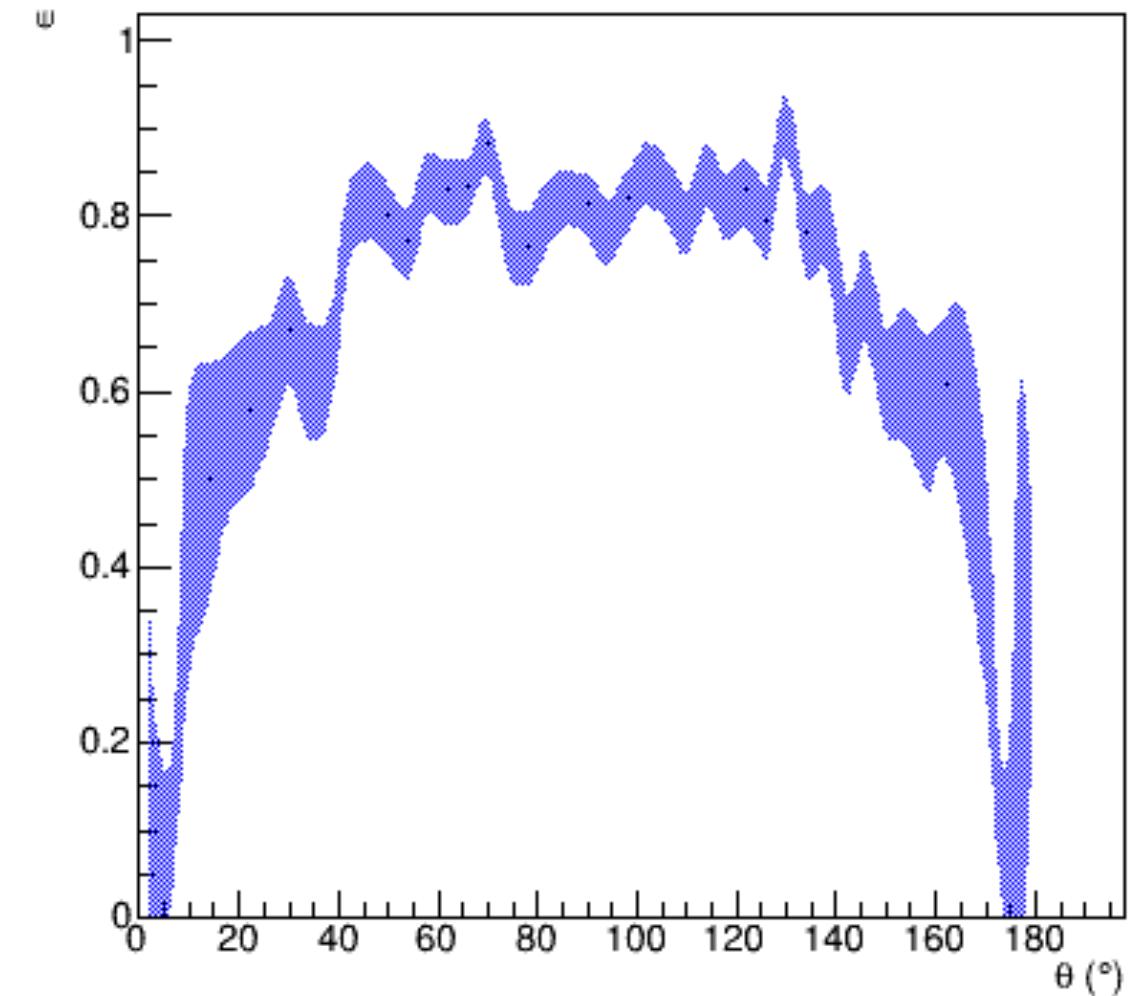

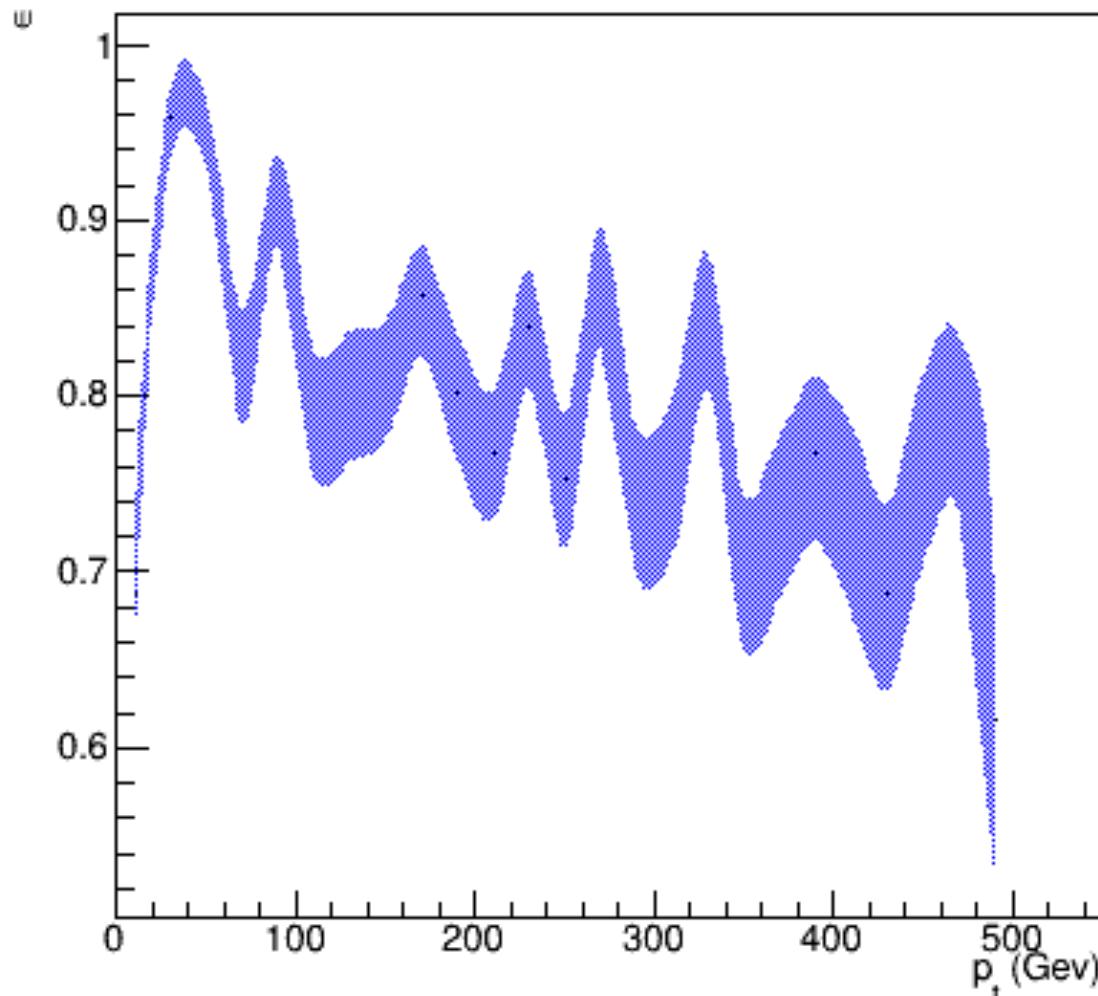

MinMuonTrackSegmentHit	5
First Layer	1
ClusterSeedStrategy	2
MinClusterOccupiedLayer	5
MinClusterLayerSpan	5
NClusterLayerToFit	100
MaxDistanceToTrack	200
MinHelixClusterCosAngle	0.98
MinTrackCandidateEnergy	7

# Physics channel – cuts efficiency

Cuts	Reconstructed muons/ reconstructed without cuts
Geometrical	99,90%
Geometrical + $p_t > 5 \text{ GeV}$	99,67%
Geometrical + $p_t > 3 \text{ GeV} + \#lay > 2$	99,84%

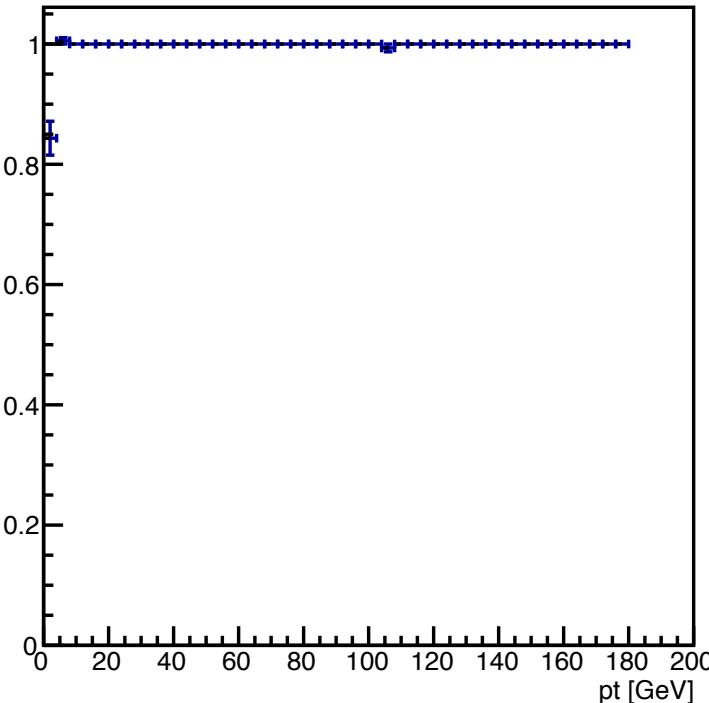

## Efficiency of muons from decay $a_d \rightarrow \mu^+ \mu^-$

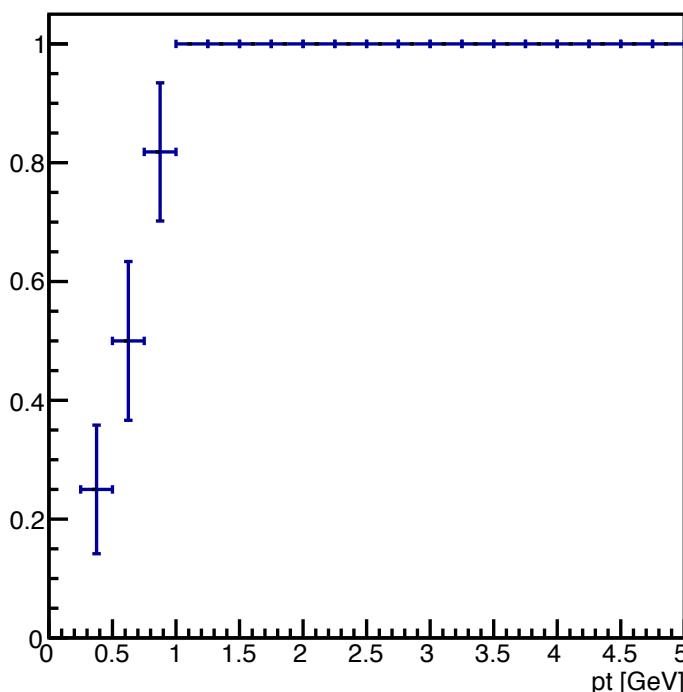

Low efficiency at low and very high  $p_t$

# Efficiency muon gun

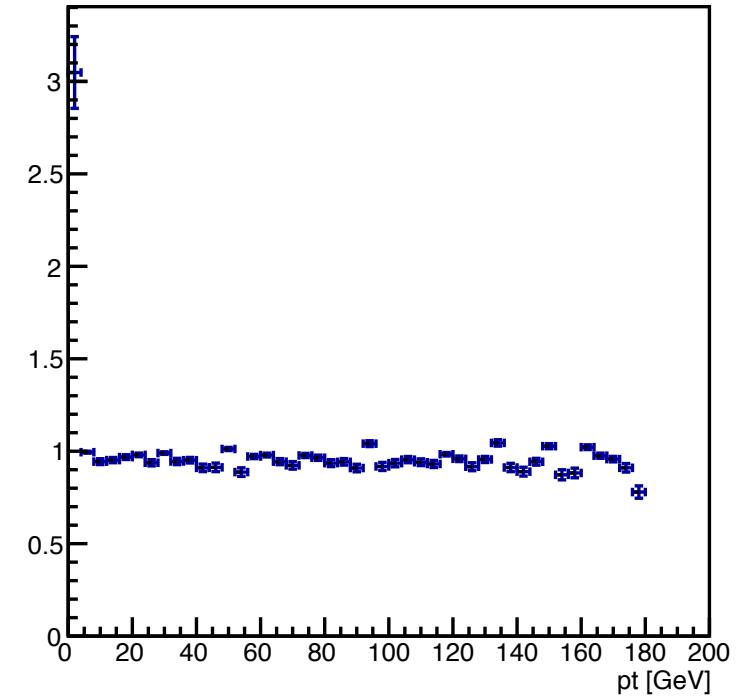

ptrel

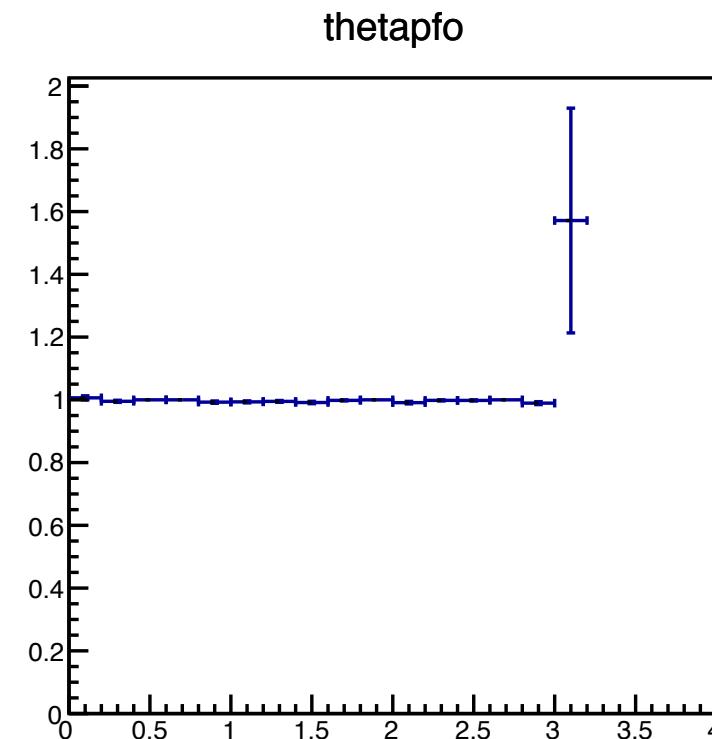

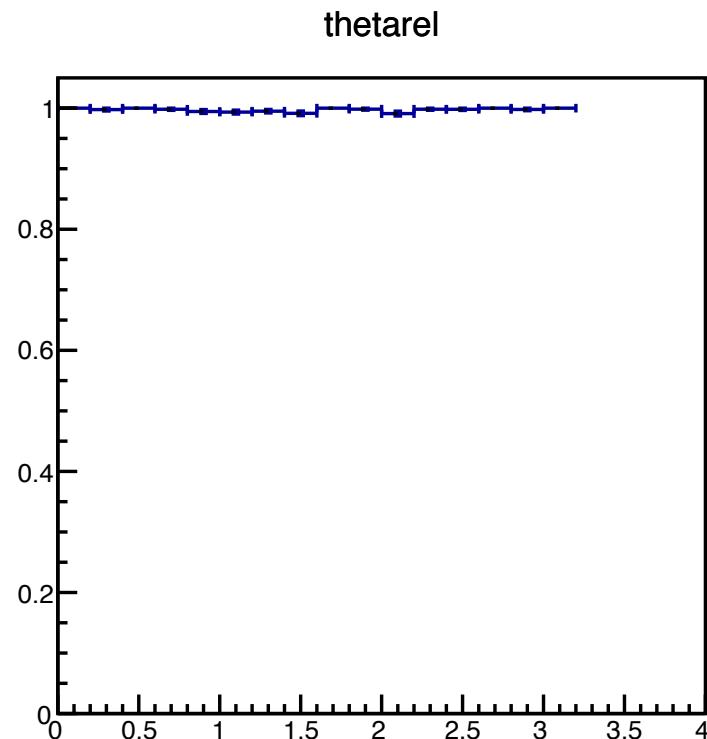

ptrel\_zoom

ptpfo

# Efficiency muon gun

# Matching

LCRelation between:

- PFO & MCParticle at track level
- Pandora Cluster hits &  
SimCalorimeter Hit at hit level
