Type: Oral presentation

Toward a resolution of the NN controversy

Tuesday, July 27, 2021 2:15 PM (15 minutes)

Lattice QCD calculations of two-nucleon interactions have been underway for about a decade, but still haven't reached the pion mass regime necessary for matching onto effective field theories and extrapolating to the physical point. Furthermore, results from different methods, including the use of the Luscher formalism with different types of operators, as well as the HALQCD potential method, do not agree even qualitatively at very heavy pion mass. In this talk I will discuss these issues and present steps toward an understanding of the various systematics at play.

Primary authors: NICHOLSON, Amy (University of North Carolina at Chapel Hill); WALKER-LOUD, Andre (Lawrence Berkeley National Laboratory); MORNINGSTAR, Colin (Carnegie Mellon University); BULAVA, John Merritt; VRANAS, Pavlos (LLNL); HOERZ, Ben; CHANG, Chia Cheng (University of California, Berkeley); HANLON, Andrew (Helmholtz-Institut Mainz, JGU); BERKOWITZ, Evan; RINALDI, Enrico (Lawrence Livermore National Laboratory); HOWARTH, Dean (Boston University); KOERBER, Christopher; LEE, Wayne Tai; CLARK, Kate (NVIDIA)

Presenter: NICHOLSON, Amy (University of North Carolina at Chapel Hill)

Session Classification: Hadron Spectroscopy and Interactions

Track Classification: Hadron Spectroscopy and Interactions
