The systematic effects study in lattice calculation of soft function

Wednesday 28 July 2021 06:45 (15 minutes)

The transverse momentum dependent soft function introduced to describe soft-gluon effects plays an important role in QCD factorization. We present a lattice QCD study on this function by simulating pion matrix element and quasi TMD wave function using the large momentum effective theory. The momenta we adopted are up to 3 GeV. Various systematic effects are examined in our study.
