LHCTopWG Meeting, 2021

### **CMS-PAS-TOP-19-009**

## Soureek Mitra (Karlsruher Institut für Technologie)

On behalf of CMS collaboration

- Top quark mass  $(m_t)$  is an important parameter of SM
- $\rightarrow$  Largest contributor in <u>radiative corrections</u> to W mass and Higgs self-coupling among SM particles  $\Rightarrow$  stability of EW vacuum •  $\Delta m_t = m_t - m_{t^-} \rightarrow \text{test of CPT invariance} \Rightarrow \text{Lorentz symmetry}$
- Traditionally  $m_t$  measurements performed with tt<sup>-</sup> events
- Measurement in single top provides
  - measurement in an independent process
  - $\rightarrow$  lower energy scale (>170 GeV) compared to tt<sup>-</sup> (> 300 GeV)
  - $\rightarrow$  partially uncorrelated systematics from tt<sup>-</sup> measurements
- ATLAS@8TeV (<u>ATLAS-CONF-2014-055</u>) :
  - → Measurement:  $m_t = 172.2 \pm 0.7$  (stat.)  $\pm 2.0$  (syst.)  $GeV = 172.2 \pm 2.1 GeV$
  - → Dominant Unc.: JES ( $\pm 1.5 \text{ GeV}$ ), t ch. Had. modeling ( $\pm 0.7 \text{ GeV}$ )
- CMS@8TeV (EPJC 77 (2017) 354) :
  - → Measurement:  $m_t = 172.95 \pm 0.77 \text{ (stat.)} + 0.97 \text{ (syst.)} \text{ GeV} = 172.95 + 1.24 \text{ GeV}$
  - → Dominant Unc.: JES  $(^{+0.68}_{-0.61} \text{ GeV})$ , Fit Calibration  $(\pm 0.39 \text{ GeV})$

### Motivation

### Summary of *m<sub>t</sub>* measurements (so far)

### **Direct** measurements $\rightarrow m_t$ reconstructed from daughters $\Rightarrow$ running mass

1

### **Event Topology and Dominant bkgs.**

### $t - ch : \sigma(13 \text{ TeV}) = 217.0^{+9.1}_{-7.7} \text{ pb}$

### 2-jets-1-tagged (2J1T)

- Large cross section but low selection efficiency  $\Rightarrow$  require very high stat. MC sample for accurate templates after event selection
- $\bigcirc$  QCD-enriched side-band (SB) in data  $\rightarrow$  invert rel. isolation (identification) criteria of the muon (electron) in the final state
- ML fit to data in Signal region to extract normalization using QCD template from SB  $\rightarrow$  Proof of concept in 2J0T and estimation in 2**J**1**T**
- Shape derived from SB and post-fit yield  $m_T^W > 50$  GeV for QCD bkg. considered for further analysis
- $\sim$  50% variation (shape + normalization) on the estimated QCD bkg. contribution as a systematic for final measurement

## Estimation of QCD multijet bkg.

### Event yields separated by lepton charge and flavor

- Determine neutrino four-momenta from lepton and Missing  $p_{T}$
- Estimate neutrino  $p_{\tau}$  from lepton four-momentum and Missing  $p_{T}$

$$m_W^2 = \left(E_\ell^2 + \sqrt{\not p_T^2 + p_{z,\nu}^2}\right)^2 - \left(\vec{p}_{T,\ell} + \vec{\not p}_T\right)^2 - \left(p_{z,\ell} + p_z\right)^2$$

• Quadratic solution for neutrino  $p_7$ : ☞ For real case (~ 65%):

 $\rightarrow$  choose the one with lowest | p<sub>7</sub> | (accuracy ~ 64%) For imaginary case (~ 35%):

- Set radical equal to  $0 \Rightarrow$  quadratic Eqn. in neutrino  $p_x$  and  $p_y$
- $\rightarrow$  vary neutrino p<sub>x</sub> and p<sub>y</sub> keeping above Eqn. satisfied so that neutrino p<sub>T</sub> has lowest  $\Delta \varphi$  with Missing  $p_T$

Reconstruct W-boson from lepton and neutrino four-momenta  $\bigcirc$ Reconstruct top quark from b-jet and W-boson four-momenta

Four-momentum of the b-quark from top quark decay approximated using b-tagged jet  $\Rightarrow m_t^{MC}$ 

# **BDT discriminators**

• Selected cut value corresponds to  $\approx 60\%$  signal purity

BDT selection threshold optimized at minimum unc. due to calibration vs true mass

## *m*<sub>t</sub> after BDT selection

•  $m_t$  distribution <u>highly skewed</u>  $\rightarrow$  difficult to model accurately using parametric shapes  $\Rightarrow$  Use *In m<sub>t</sub>* for fit  $\rightarrow$  low skewness, more symmetric and easy to model

![](_page_9_Picture_4.jpeg)

![](_page_10_Picture_0.jpeg)

## Extraction of *m*<sub>t</sub>

- QCD bkg. contribution is subtracted from data  $\rightarrow$  50% variation (shape + norm.) in estimated QCD bkg. contribution added as separate systematic source
- Simultaneous ML fit using  $y = ln m_t$  distributions in  $\mu$  and e final states  $F(y; y_0, f_{t-ch.}, f_{Top}, f_{EWK}) = f_{t-ch.} \cdot F_{t-ch.}(y; y_0) + f_{Top} \cdot F_{Top}(y; y_0) + f_{EWK} \cdot F_{EWK}(y)$ 
  - $> y_0$ : POI, represents the peak position of the combined template of t ch. and Top  $> m_{Fit} = TMath::Exp. (y_0)$  $> F_{t-ch}$  = asymm. Gauss. core + Landau tail  $\succ$   $F_{Top}$  = Crystal ball

 $> F_{EWK} = Novosibirsk$ 

Signal and bkg. rates added as nuisance parameters to the fit & constrained using log-normal priors based on respective cross sections

$$f_{t-ch} \rightarrow 15\%, f_{Top}$$

- Parametric fit model validated in bkg. enriched control region defined by -0.2 < BDT < 0.8</p>
- Separate fits for  $\ell^+$ ,  $\ell^-$ ,  $\ell^\pm$  final states

![](_page_10_Picture_10.jpeg)

 $\rightarrow 6\% \& f_{EWK} \rightarrow 10\%$ 

![](_page_11_Picture_0.jpeg)

![](_page_11_Picture_1.jpeg)

![](_page_11_Figure_2.jpeg)

- Peak region well-modeled by fit
- Higher relative bkg. contribution in the  $\ell^-$  final state
  - charge asymmetry of W boson radiated from the initial state quark in the signal process
    in the sin the signal process
    in the signal

![](_page_11_Figure_7.jpeg)

![](_page_12_Picture_0.jpeg)

## Offset calibration w.r.t true mt

![](_page_12_Figure_4.jpeg)

![](_page_12_Picture_5.jpeg)

![](_page_13_Picture_0.jpeg)

![](_page_13_Picture_1.jpeg)

- Signal and bkg. rates are added as nuisance parameters in the fit (profiled systematic sources)
- $\sim$  All other syst. sources externalized  $\rightarrow$  fit repeated with varied templates (conservative approach)
- Asymmetric uncertainties on the measurements
- Largest shift relative to the nominal result quoted in case of one-sided impact (conservative approach)
- Dominant sources on the  $\ell^{\pm}$  case highlighted by shaded region
- Larger syst. uncertainties in case of  $\ell^-$  final state due to higher relative bkg. contribution

## Systematic Uncertainty Estimation

- Signal and bkg. rates are added as nuisance parameters in the fit (profiled systematic source) • All other sources externalized  $\rightarrow$  fit repeated with varied templates (conservative approach) **Experimental**
- **JES**: sub-categorized into different correlation groups according to <u>JME-15-001</u>
- Unclustered energy: 10% variation
- Lepton efficiencies: Total unc. on the efficiency SFs due to identification, isolation and trigger
- $\square$  Pileup re-weighting: 4.6% unc. on  $\sigma_{\min \text{ bias}} = 69.2 \text{ mb}$
- **b-tagging**: unc. on efficiency SFs based on jet kinematics and tagger discriminators
- See QCD bkg.: 50% unc. on the estimated QCD bkg.
- rightarrow offset correction:  $\pm 1\sigma$  unc. from the offset calibration curve
- ☞ Luminosity: 2.5% unc. according to LUM-17-001

![](_page_22_Picture_12.jpeg)

### **Modeling**

Flavor-dependent JES: Correlated across jet flavors (gluon, light [uds],

charm and bottom) as well as *signal and bkg. processes* 

b-quark had. model: Dedicated <u>event weights</u> for

- $\rightarrow$  ±1 $\sigma$  variations of Bowler-Lund parameters
- comparison with Peterson parameterization
- → unc. on semi-leptonic branching ratio of B hadrons from PDG

Color Reconnection (CR): 2 alternate CR models considered for *t* - *ch*.

and *tt*<sup>-</sup>simultaneously using *dedicated MC samples* 

Signal modeling: Dedicated <u>event weights</u> corresponding to

- → ISR and FSR scale variations
- $\rightarrow \mu_{\rm B}/\mu_{\rm F}$  scale variations
- $\rightarrow$  **PDF (NNPDF3.0)** +  $\alpha_{s}$  variations
- *<sup>™</sup> tt*<sup>−</sup>Modeling:
  - → using <u>dedicated MC samples</u> for variations of ISR & FSR scales, ME-PS matching scale & UE tune
  - $\rightarrow$  <u>event weights</u> for  $\mu_{\rm B}/\mu_{\rm F}$  scale, PDF+  $\alpha_{\rm S}$  & top  $p_{\rm T}$  re-weighting

 $rightarrow Signal and bkg. shape: \pm 3\sigma$  variation of shape parameters
