

Study of the silvering process of ancient Roman coins using nuclear-physical methods and complementary techniques

Monday, 20 September 2021 18:05 (5 minutes)

Monetary system in ancient time was a challenging task, influenced by economic crisis, availability of metal sources and monetary reforms. In particular, the Ag content of the currency minted for about sixty years by the Antoninii emperors reflected the economic health or crisis of the Roman Empire. At the beginning, the Antoninianus denomination was a silver-rich coin (up to 80% of Ag), but gradually was devalued becoming a bronze coin with a very low content of silver (about 2–3% of Ag).

Two of ancient Roman silver coins (one of them was mint as barbarian imitations of roman coin), dating back between III-IV Centure AD have been characterized. We used a set of modern micro- and non-invasive analytical techniques: Focused Ion Beam-Field Emission Scanning Electron Microscopy-Energy Dispersive X-ray Microanalysis (FIB-FESEM-EDXM), Scanning Electron Microscopy (SEM-EDX), Micro-X-ray Fluorescent analysis (μ XRF), Synchrotron- and Neutron-based Computer Tomography (CT), Synchrotron-based X-ray Diffraction (XRD), Neutron Radiation Analysis (NRA) that offers the most advantageous means of obtaining access to the bulk composition and other complementary methods.

The results revealed that a complex Ag-Cu and Ag-Cu-Pb-Sn alloys were used. The use of alloys was common in the flourishing years of the Roman Empire. In the prosperous periods, Romans produced Ag-Cu alloys with relatively high silver content for the manufacture of both the external layers and inner nucleus of coins. This study also revealed that, although surface silvering processes were applied in different periods of crisis under the reign of Antoninii, even during crisis, Romans produced Antoninianus of high quality. It possible, moreover, a first attempt to improve the silvering procedure using Hg-Ag amalgam has been identified, because Hg was detected in the upper silver layer of coins.

Primary authors: Dr PAKHUNOV, Aleksander (Institute of Archaeology RAS); Mr GRESHNIKOV, Eduard (NRC "Kurchatov Institute"); Dr SOZONTOV, Evgeny (NRC "Kurchatov Institute"); Dr TRUN'KIN, Igor' (NRC "Kurchatov Institute"); Dr GOVOR, Lev (NRC "Kurchatov Institute")

Presenter: Dr SOZONTOV, Evgeny (NRC "Kurchatov Institute")

Session Classification: Poster session (Mixed)

Track Classification: Section 9. Nuclear-physical methods in the study of cultural heritage objects.
