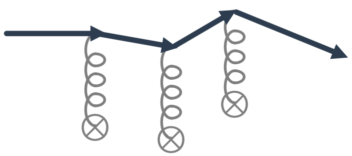
QCD with medium bkg:

- Colored background $\mathcal{A}_0(t, x)$
- Energy is conserved (p^+), transverse kick $(\boldsymbol{p})$
- Multiple scatterings



Keeping space-time: partial Fourier space $(p^+, \boldsymbol{p}, p^-) \rightarrow (p^+, \boldsymbol{x}, t)$

- Effective propagator:

$G_s^c(p^+, \boldsymbol{p}_t, p^-)$ $\qquad$ $G_{s_1 s_2}^{c_1 c_2}(t_f, \boldsymbol{x}_f, t_i, \boldsymbol{x}_i | p^+)$

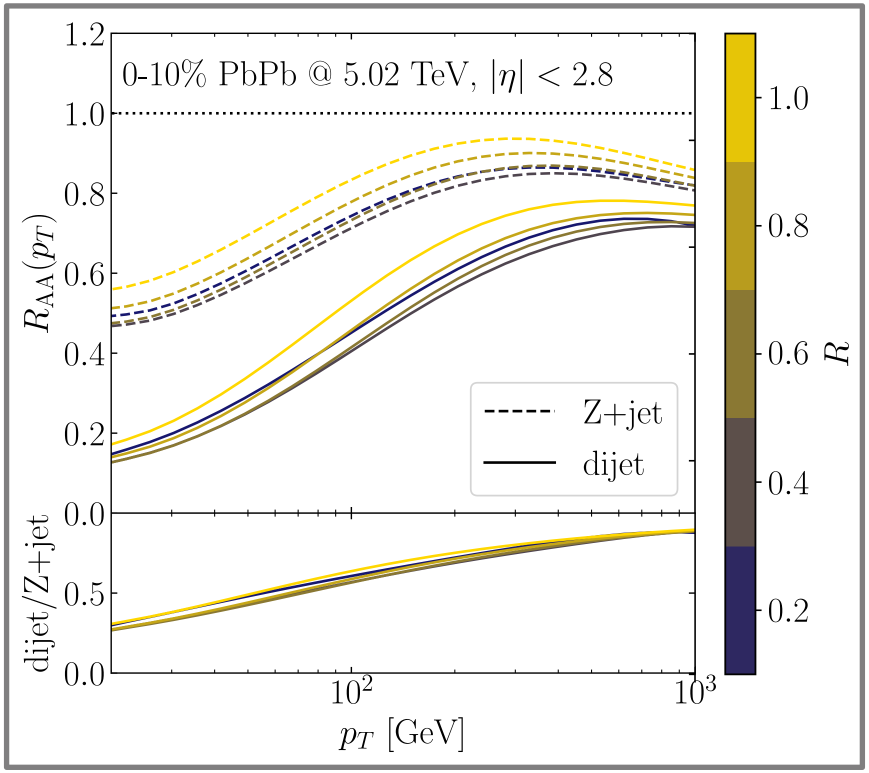
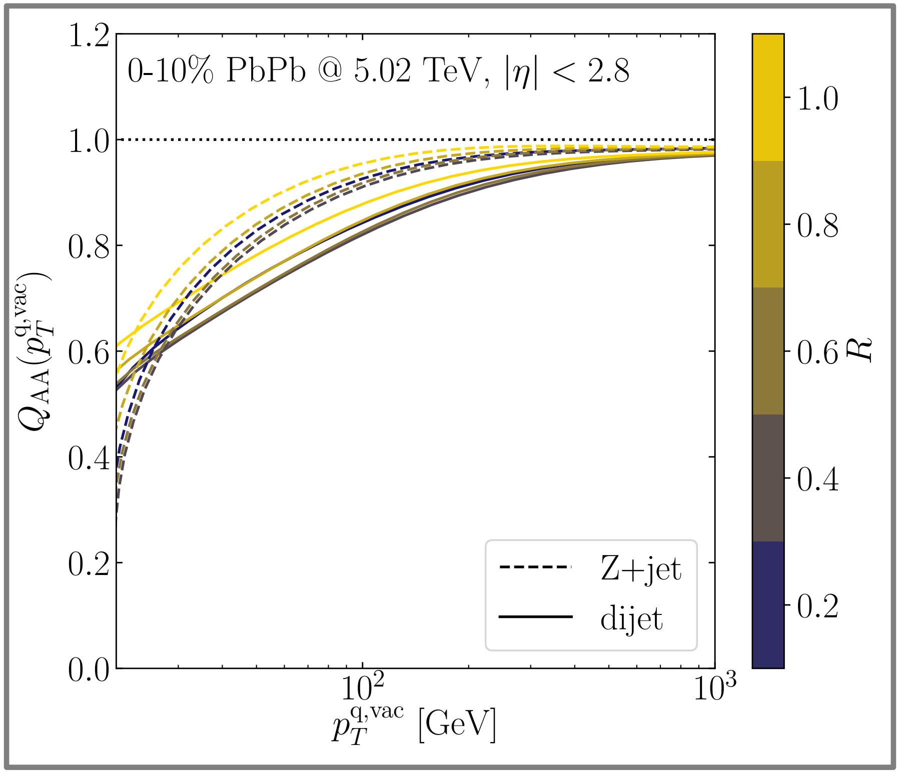
Quenching weight





Introduction: What is the jet R_{AA}?

- Definition:

$$R_{\mathrm{AA}}(p_T) = \frac{d\sigma^{\mathrm{med}}}{dp_T}(p_T) \Bigg/ \frac{d\sigma^{\mathrm{vac}}}{dp_T}(p_T)$$

- R_{AA}: Compares jets in vacuum to jets in medium at the **same** p_T.
- Jet with p_T in medium loose energy and ends up with p_T - ε.
- Complication 1:
  R_{AA} doesn't compare the "same" jets!

- The spectrum is steeply falling $n \gg 1$.

$$\frac{d\sigma}{dp_T} \sim p_T^{-n}$$

- Complication 2:
  R_{AA} is sensitive to n (bias on energy loss)!
