und Forschung

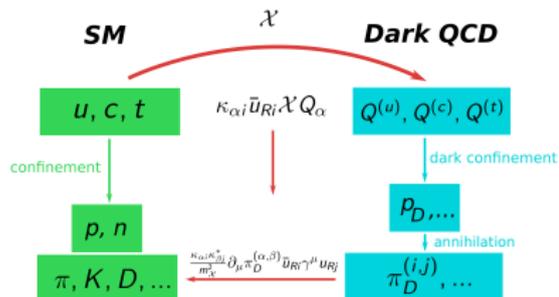

## Motivation/Framework

- ALPs are ubiquitous in BSM models
- can have non-trivial interaction with flavour & forward physics phenomenology
- focus on up-sector:

$$\mathcal{L}_{eff} = \frac{1}{2}(\partial_\mu a)(\partial^\mu a) - \frac{m_a^2}{2}a^2 + \frac{\partial_\mu a}{f_a} \left[ (c_{u_R})_{ij} \bar{u}_{Ri} \gamma^\mu u_{Rj} + c_H H^\dagger i \overleftrightarrow{D}_\mu H \right] \\ - \frac{a}{f_a} \left[ c_{gg} \frac{g_3^2}{32\pi^2} G_{\mu\nu}^a \tilde{G}^{\mu\nu a} + c_{WW} \frac{g_2^2}{32\pi^2} W_{\mu\nu}^I \tilde{W}^{\mu\nu I} + c_{BB} \frac{g_1^2}{32\pi^2} B_{\mu\nu} \tilde{B}^{\mu\nu} \right]$$

- FCNCs from  $\mathcal{O}_u = \frac{\delta_\mu a}{f_a} (c_{u_R})_{ij} \bar{u}_{Ri} \gamma^\mu u_{Rj}$ ,  
 $\mathcal{O}_H = (\partial_\mu a / f_a) H^\dagger i \overleftrightarrow{D}_\mu H$ ,  $\mathcal{O}_W = (a / f_a) g_2^2 / (32\pi^2) W_{\mu\nu}^I \tilde{W}^{\mu\nu I}$   
 $\Rightarrow$  here:  $c_H, c_W$  small
- flavour-violating effects from  $\frac{\partial_\mu a}{f_a} (c_{u_R})_{ij} \bar{u}_{Ri} \gamma^\mu u_{Rj}$

# Benchmark 1: 'Dark QCD' UV completion

- $SU(3)_D$  dark sector with neutral dark quarks
- heavy mediator  $\chi \sim (3, \bar{3}, 1, -2/3)$  under  $SU(3) \otimes SU(3)_D \otimes SU(2)_L \otimes U(1)_Y$
- confinement at  $\Lambda_{darkQCD}$
- lightest dark baryon DM candidate
- various  $\pi_D$  lifetimes possible
- identify ALP with  $\pi_{D_3}$  and  $\pi_{D_8}$  (difference: coupling to tops)

Dark Pions	Dark quark content
$\pi_D^{(1,2)}$	$\bar{Q}_2 Q_1$
$\pi_D^{(1,3)}$	$\bar{Q}_3 Q_1$
$\pi_D^{(2,3)}$	$\bar{Q}_3 Q_2$
$\pi_{D_3}$	$\frac{1}{\sqrt{2}} [\bar{Q}_1 Q_1 - \bar{Q}_2 Q_2]$
$\pi_{D_8}$	$\frac{1}{\sqrt{6}} [\bar{Q}_1 Q_1 + \bar{Q}_2 Q_2 - 2\bar{Q}_3 Q_3]$

## Benchmark 1: 'Dark QCD' UV completion

- non-trivial flavour interplay from coupling  $\kappa_{\alpha i} \bar{u}_{R_i} \mathcal{X} Q_\alpha$
- parameterise the coupling  $\kappa = UDV$
- degenerate dark quark masses  $\rightarrow$  V absorbed from dark flavour symmetry
- $D = \text{diag}(\kappa_0 + \kappa_1, \kappa_0 + \kappa_2, \kappa_0 - \kappa_1 - \kappa_2)$
- U in analogy to  $V_{CKM}$ :  $U = U_{23}U_{13}U_{12}$ , with  $U_{ij}$   $3 \times 3$  rotation matrices
- benchmark:  $\kappa_1 = \kappa_0/2$ ,  $\kappa_2 = \theta_{13} = \theta_{23} = 0$ ,  $\theta_{12} = 0.022$

$$- \sum_{\alpha, \beta} \kappa_{\alpha i} \kappa_{\beta j}^* (\lambda^a)_{\alpha, \beta} \frac{f_{\pi D}}{m_\chi^2} \partial_\mu \pi_D^{(\alpha, \beta)} \bar{u}_{R_i} \gamma^\mu u_{R_j} \rightarrow (c_{u_R})_{ij} \frac{1}{f_a} \partial_\mu a \bar{u}_{R_i} \gamma^\mu u_{R_j}$$

## Benchmark 2: Froggatt-Nielsen UV completion

- global flavor  $U(1)$  broken by vev  $\langle S \rangle = f_a$   
with  $S = \frac{1}{\sqrt{2}} (f_a + s) e^{ia/f_a}$
- $S$  has charge  $-1$  under new  $U(1)$
- here: only  $u_R$  charged under new  $U(1)$
- new Yukawa term:  $-y_{u_{ij}} \left(\frac{S}{\Lambda}\right)^{n_j^u} \bar{q}_{L_i} \tilde{H} u_{R_j} + h.c.$   
 $\Rightarrow -\frac{ia}{f_a} \bar{q}_{L_i} \tilde{H} u_{R_j} Y_{u_{ij}} n_j^u$  with  $Y_{u_{ij}} = y_{u_{ij}} \left(\frac{f_a}{\Lambda}\right)^{n_j^u}$
- with  $f_a/\Lambda = \epsilon \sim m_c/m_t$ , right quark masses from  $n_j = \text{diag}(2, 1, 0)$
- after diagonalising  $Y_{u_{ij}}$ :  $c_{uR} = \begin{pmatrix} 2 & 3\epsilon & 3\epsilon^2 \\ 3\epsilon & 1 & \epsilon \\ 3\epsilon^2 & \epsilon & \epsilon^2 \end{pmatrix}$

# Constraints on the model: Flavour constraints

- $\Delta F = 2$  :  $D^0 - \bar{D}^0$  mixing

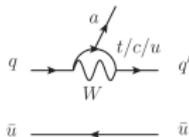

- $\Delta F = 1$  :

- tree-level:  $D^\pm \rightarrow \pi^\pm$  *invisible*,  $J/\psi \rightarrow \gamma$  *invisible*

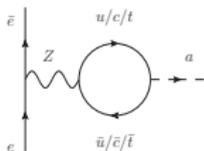

- 1-loop:  $K^\pm \rightarrow \pi^\pm$  *invisible*,  $B^\pm \rightarrow \pi^\pm / K^\pm$  *invisible*

## Constraints on the model: cosmology and astrophysic

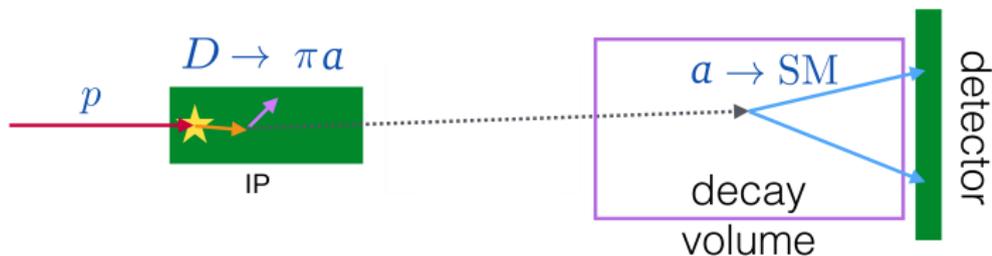

- cosmological constraints include  $\neq$  effective dof, distortion of CMB spectrum, modifications of the predicted BBN, ... (c.f. *Cadamuro, Redondo 2012; Millea, Knox 2015; Depta, Hufnagel, Schmidt-Hoberg 2020*)
- astrophysics:
  - red giant burst through effective coupling to electrons:

- SN1987a cooling through bremsstrahlung process  
 $N + N \rightarrow N + N + a$

## Forward physics prospects

- consider production in D meson decays
- possible testing grounds: NA62, SHiP, FASER, FASER 2, MATHUSLA, ...

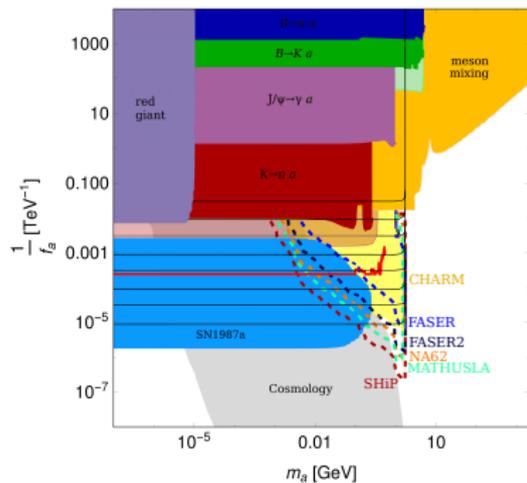

- number of ALPs:

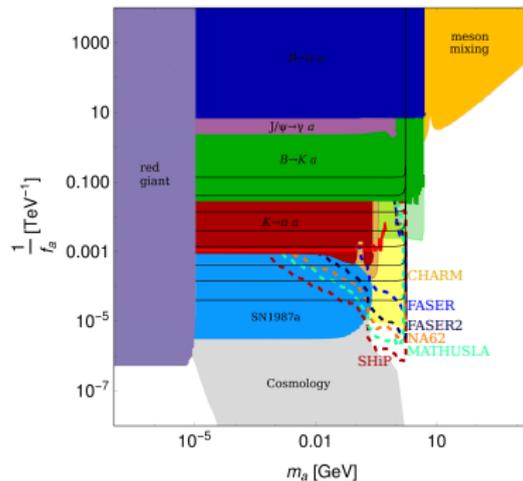

$$N_a = N_D \cdot Br(D \rightarrow \pi a) \cdot \epsilon_{geom} \cdot F_{decay}$$

- 3 events for detection

# Results: 'dark QCD' UV completion

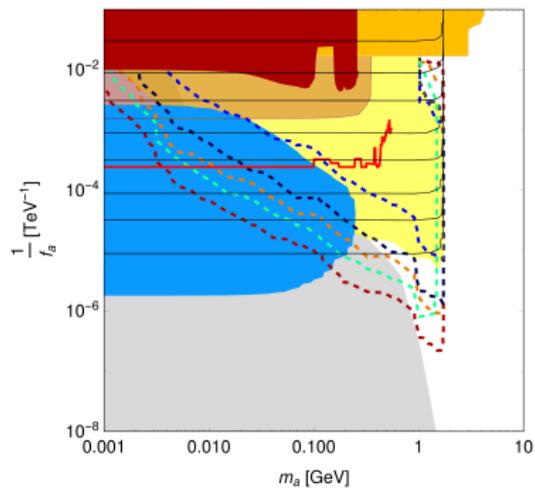

$$a \equiv \pi D_3$$

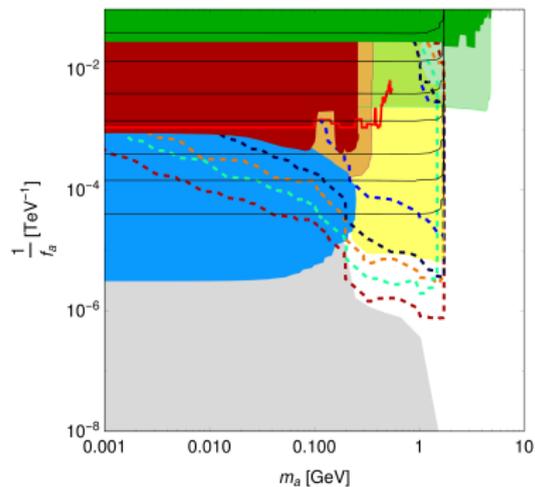

$$a \equiv \pi D_8$$

# Results: 'dark QCD' UV completion

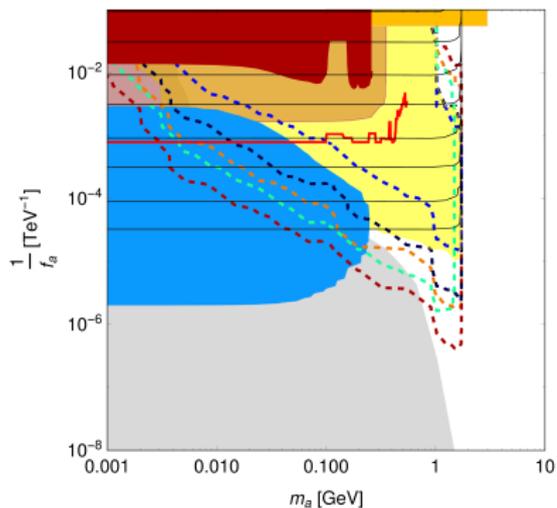

$$a \equiv \pi D_3$$

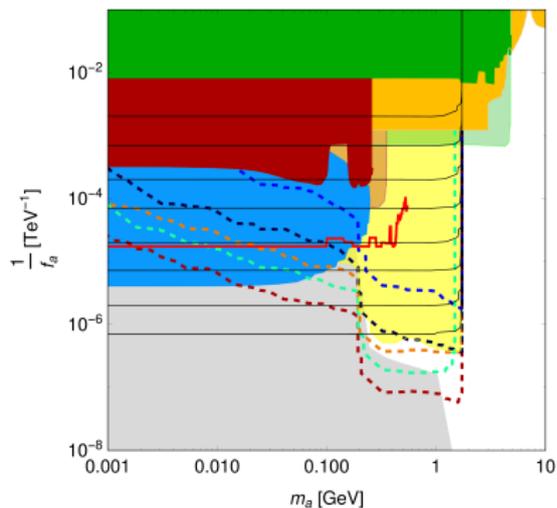

$$a \equiv \pi D_8$$

# Results: FN UV completion and anarchic benchmark

FN

$(c_{u_R})_{ij} = 1$

## Summary and Outlook

- search for NP in charm physics
- parameters space with forward physics phenomenology unconstrained
- $m_a \sim \text{few GeV}$  can be probed at forward physics facilities
- higher mass region ideas:
  - additional production modes, e.g. top decays
  - charming emerging jets, prompt decay searches
  - in dark QCD: DM direct detection
