Development of the ATLAS Liquid Argon Calorimeter Readout Electronics for the HL-LHC

Wednesday, 1 September 2021 12:40 (25 minutes)

To meet new TDAQ buffering requirements and withstand the high expected radiation doses at the high-luminosity LHC, the ATLAS Liquid Argon Calorimeter readout electronics will be upgraded. Developments of low-power preamplifiers and shapers to meet low noise and excellent linearity requirements are ongoing in 130nm CMOS technology. In order to digitize the analogue signals on two gains after shaping, a radiation-hard, low-power 40 MHz 14-bit ADCs is developed in 65 nm CMOS. The signals will be sent at 40 MHz to the off-detector electronics, where FPGAs connected through high-speed links will perform energy and time reconstruction through the application of corrections and digital filtering. The data-processing, control and timing functions will be realized by dedicated boards connected through ATCA crates. Results of tests of prototypes of front-end components will be presented, along with design studies on the performance of the off-detector readout system.

Is this abstract from experiment?

Yes

Name of experiment and experimental site

ATLAS

Is the speaker for that presentation defined?

No

Details

N/A

Internet talk

Maybe

Primary authors: AAD, Georges (CPPM, Aix-Marseille Université, CNRS/IN2P3 (FR)); LORENZO MARTINEZ, Narei (Centre National de la Recherche Scientifique (FR))

Presenter: BENOIT, Mathieu (Brookhaven National Laboratory (US))

Session Classification: Mini Workshop on Instruments and Methods in HEP
