## Strong inhibition of convection in Dirac semimetals

*Tuesday 31 August 2021 08:30 (30 minutes)*

It is shown that the convective instability in electron fluids in 3D and 2D Dirac semimetals is strongly inhibited. The major obstacles for the convection are the effects of the Coulomb forces and the momentum relaxation related to the interaction with impurities and phonons. The effect of the Coulomb forces is less pronounced in 2D materials, such as graphene. However, momentum relaxation still noticeably inhibits convection making it very difficult to achieve in practice.

### Is this abstract from experiment?

No

### Name of experiment and experimental site

N/A

### Is the speaker for that presentation defined?

Yes

### Details

Eduard Gorbar, professor, Bogolyubov Institute for Theoretical Physics, Ukraine

### Internet talk

Yes

**Primary authors:** GORBAR, Eduard (Bogolyubov Institute for Theoretical Physics); SHOVKOVY, Igor (Arizona State University); SUKHACHOV, Pavlo

**Presenter:** GORBAR, Eduard (Bogolyubov Institute for Theoretical Physics)

**Session Classification:** Workshop on Lattice and Condensed Matter Physics
