## DO STUDENTS' ATTITUDES TOWARDS PHYSICS DEPEND ON GENDER?

*Wednesday, December 15, 2021 4:45 PM (5 minutes)*

The purpose of this study was to analyze whether high school and university students' attitudes towards physics show evidence of a gender bias. To this aim, we used a new framework, the Semiotic Cultural Psychological Theory (SCPT). A view-of-physics questionnaire was used as instrument to collect data with 1,603 high school and university Italian students. We identified four attitudes towards physics: a) interesting and important for society; b) quite interesting, but not useful for society; c) difficult and irrelevant for society; d) niche that protect from society. The identified attitudes do show a significant gender bias but with a weak effect.
