Improving women motivation in learning Physics

Wednesday, December 15, 2021 11:05 AM (5 minutes)

We want to analyze the motivations in the study of physics in pre-university educational levels. 69 undergraduate students who learnt with a Brain-Based Teaching Approach (BBTA) methodology (Socratic style) were compared to a sample with the same N who had learnt in a masterclass style. Both groups were analysed through Academic Motivation Scale (AMS). T-test and U Mann-Whitney analysis suggest amotivation is the same in both groups, but extrinsic motivations are higher in the classic style group, while the intrinsic motivations are higher in the Socratic one, specially for women ($p < 0,032$). To learn Physics in the proposed way seems to reinforce intrinsic motivations.

Primary authors: Dr REYES, Héctor (Physics and Chemistry Department, International High School J.H.Newman, Madrid, Spain.); Dr MIRÓN CANELO, José Antonio (Department of Biomedical Sciences. Researcher at the Institute of Biomedical Research of Salamanca (IBSAL), Faculty of Medicine, University of Salamanca, Spain); Dr GARCÍA GONZÁLEZ, Juan Manuel (Sociology Department, Pablo de Olavide University, Seville, Spain.)

Presenter: Dr REYES, Héctor (Physics and Chemistry Department, International High School J.H.Newman, Madrid, Spain.)

Session Classification: Parallel 7 - Wroclaw

Track Classification: 15. Nature of Science, gender and socio-cultural issues in physics education
