Contribution ID: 277 Type: Oral Presentation

Antineutrino Detectors for a High-Precision Measurement of theta13 at Daya Bay

Saturday 11 June 2011 12:00 (30 minutes)

The Daya Bay reactor neutrino experiment is designed to measure the last unknown neutrino mixing angle theta_13 with a sensitivity of sin^22theta_13<0.01. The experiment will use eight identical liquid scintillator detectors with 20-ton target mass installed at three underground sites to measure the flux and spectrum of reactor antineutrinos from the Daya Bay nuclear power plant and search for subdominant neutrino oscillation. Control of the relative detector systematics to <0.4% is critical for the experiment's sensitivity. We will describe the design, construction, and performance of the Daya Bay antineutrino detectors.
