JEM-EUSO – Overview

Omega

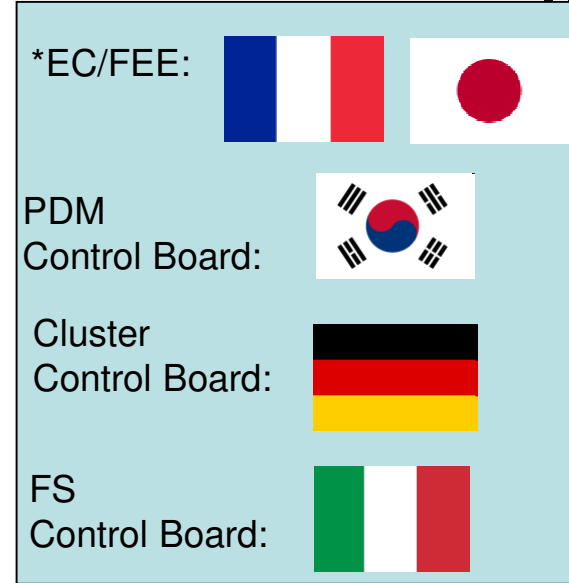

- A RIKEN-led project that will be installed on International Space Station (~ 2016).
- Installation on JAXA's "Kibo" External Exposure Module
- International collaboration (Asia, EU, US) supported by 3 space agencies (JAXA, NASA, ESA).

Multi-purpose experiment:

- Study of cosmic rays and their sources
- Study of atmospheric physics
- Study of meteors
- Lightning study...

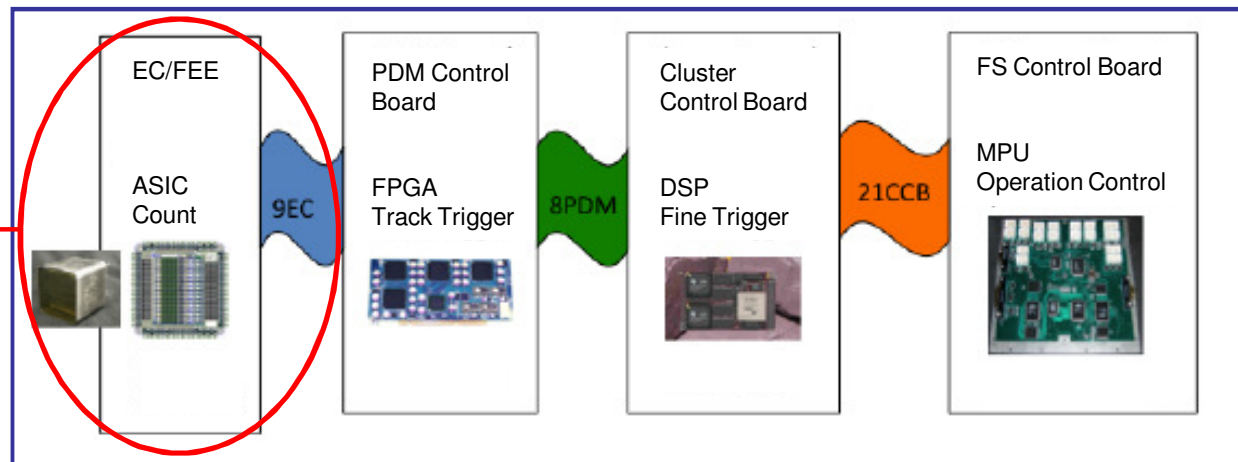

JEM-EUSO – Focal Surface Detector

JEM-EUSO Data Acquisition Core Outline

~5000 MAPMTs
 ~5000 ASICs
 ~300k pixels

**SPACIROC
 ASIC**

SPACIROC - Spatial Photomultiplier Array Counting and Integrating ReadOut Chip

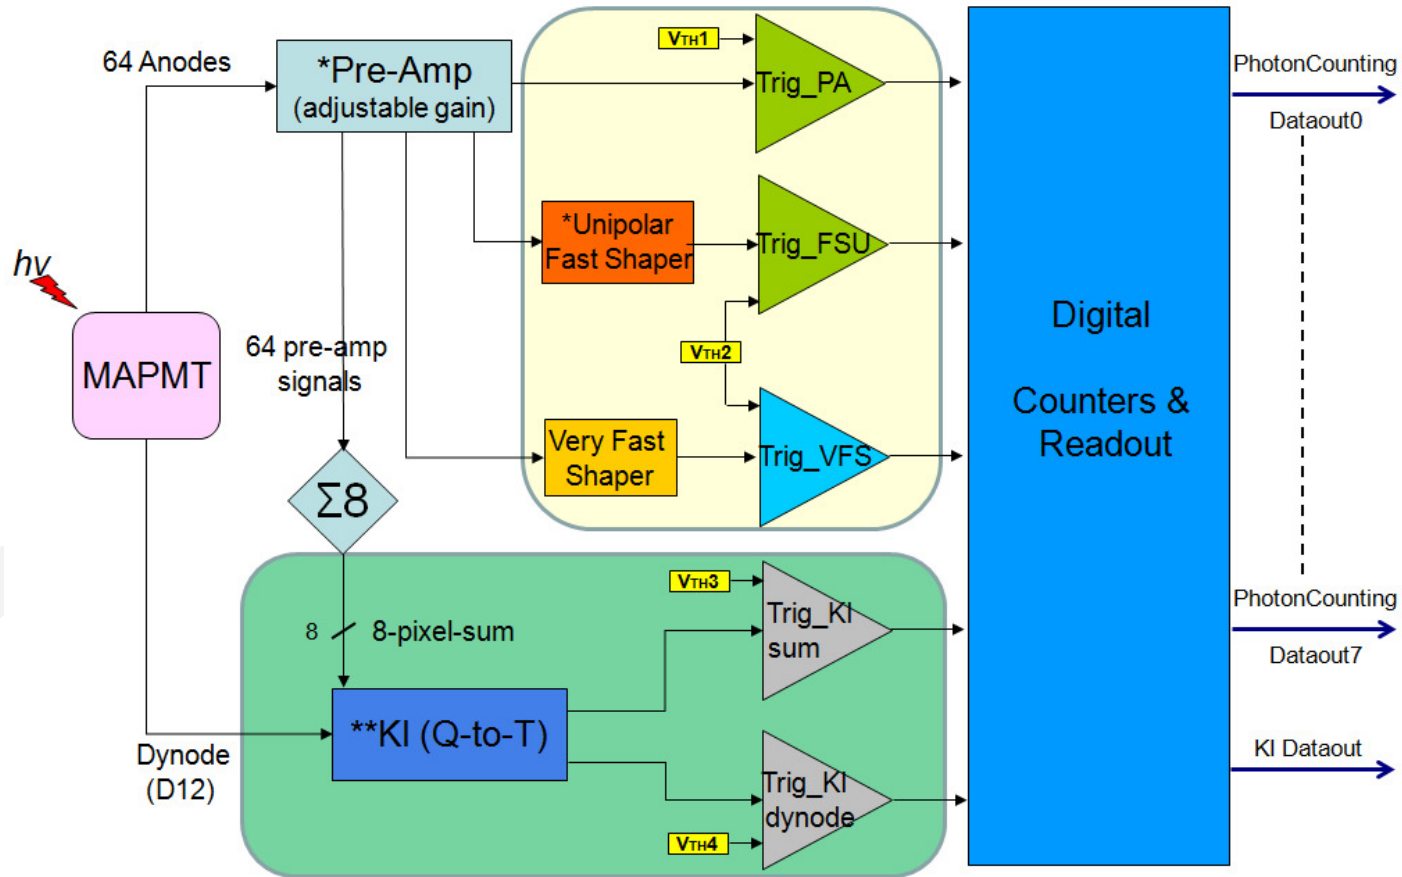

- Readout chip for 64 channels MAPMT
- Low-power & radiation hardened
- Co-designed by LAL/ JAXA/ RIKEN

Features:

- 64 preamplifier with individual 8-bit gain adjustment
- 64 channels photon counting
 - 100% trigger efficiency: 50fC (1/3 pe @ 10^6 MAPMT gain)
 - Double pulse resolution : 30 ns
- Charges to Time (Q-to-T) converters
 - Pixels charge measurement: 2.5pC – 250pC
 - MAPMT protection > 250pC
- Continuous Data acquisition & Readout every 2.5 μ s (GTU)
- Radiation hardness
- Power budget : 1mW/channel

SPACIROC – Architecture

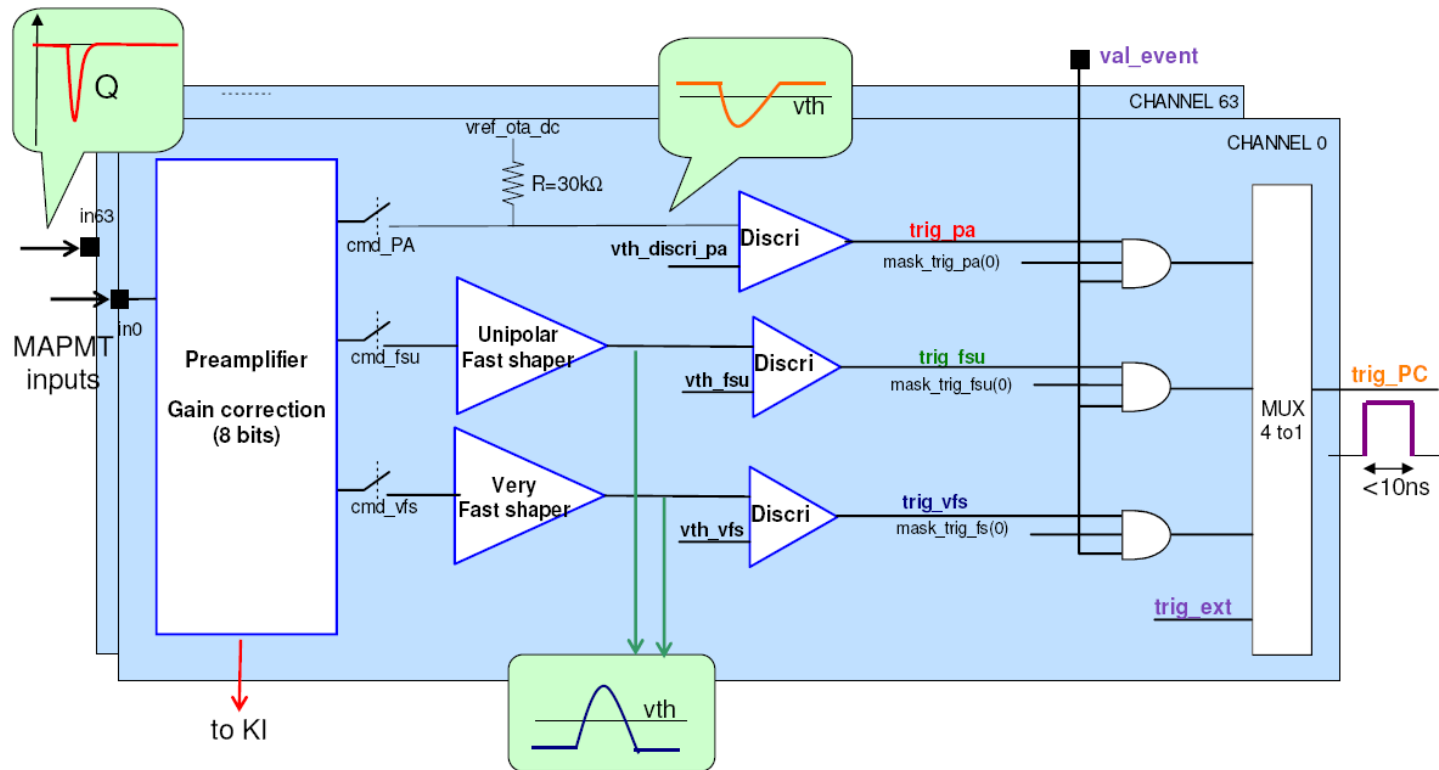

Omega

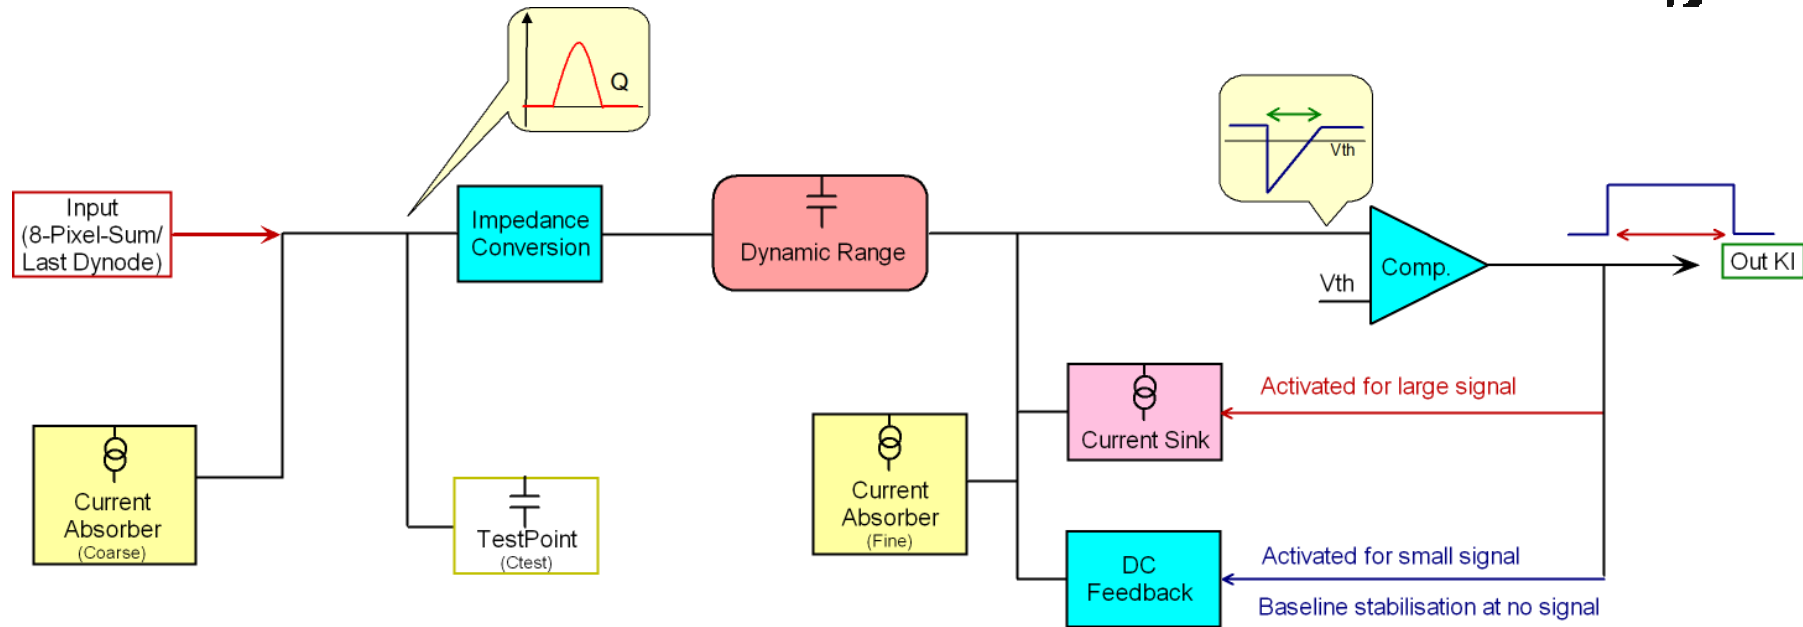

Specifications:

- Consumption: 1mW/channel
- Photon counting: 100% trigger efficiency@50fC (1/3pe, 10^6 Gain)
- KI input range : 2.5pc – 250pc (15.6pe - 1560pe)
- Radiation hardness
- Data out : Startbit + 64 bits + Parity

SPACIROC – Photon Counting

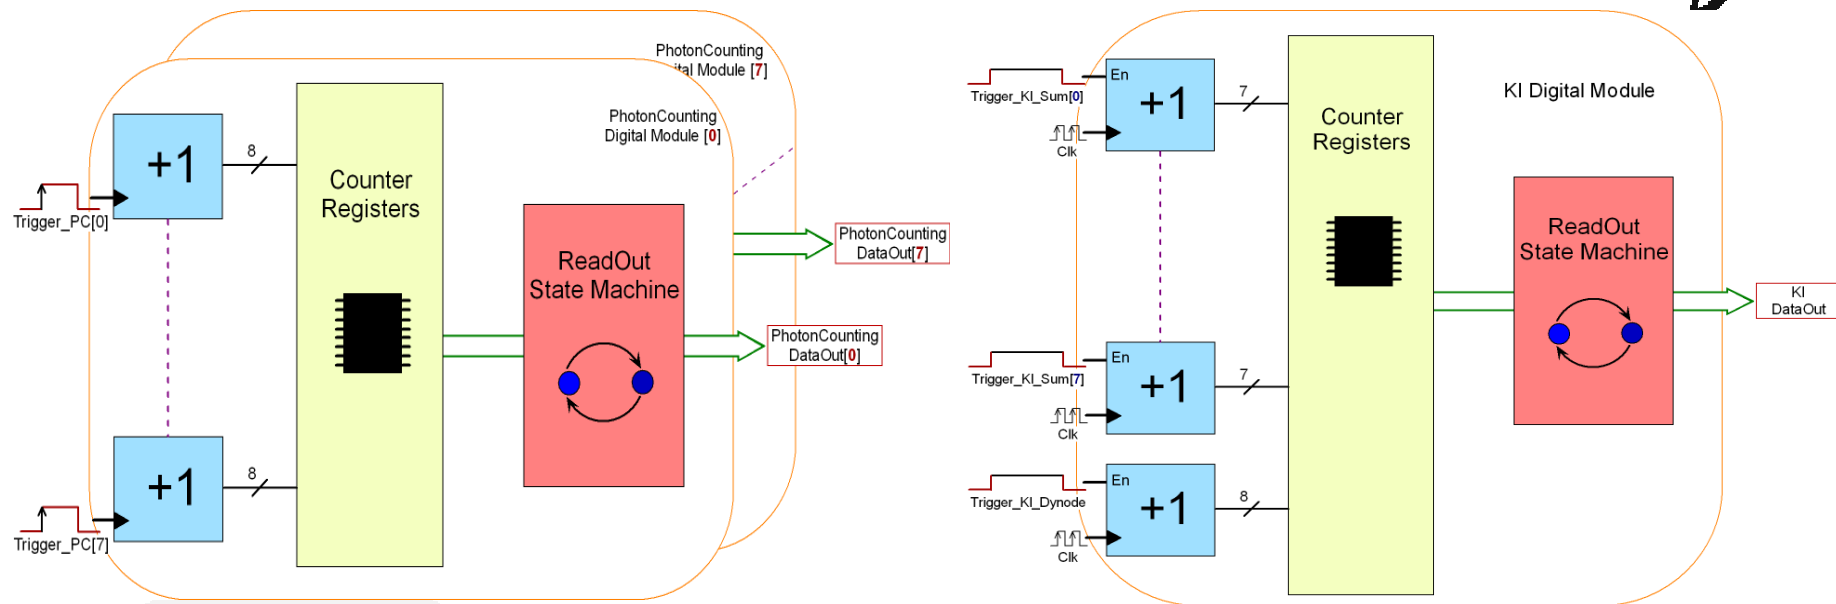

- 3 Discriminator outputs : Trig_PA, Trig_FSU, Trig_VFS
- Multiplexed Discriminator outputs to Digital part
- 2 x10-bit DAC for Discriminators threshold setting
- Available parameters: Preamp gain, Shaper & Discriminator Selection, Channel masking, FSU gain, KI summing,..

- Designed in collaboration with JAXA/RIKEN
- KI: 8 channels (8-Pixel-Sum) + 1 channel (Dynode)
- 2 x 10-bit DACs for setting the threshold
- Available parameters : Current absorber (Coarse/Fine), Integration Capacitors, Pulse Width Adjustment, Channel masking,...

SPACIROC – Digital Architecture

Omega

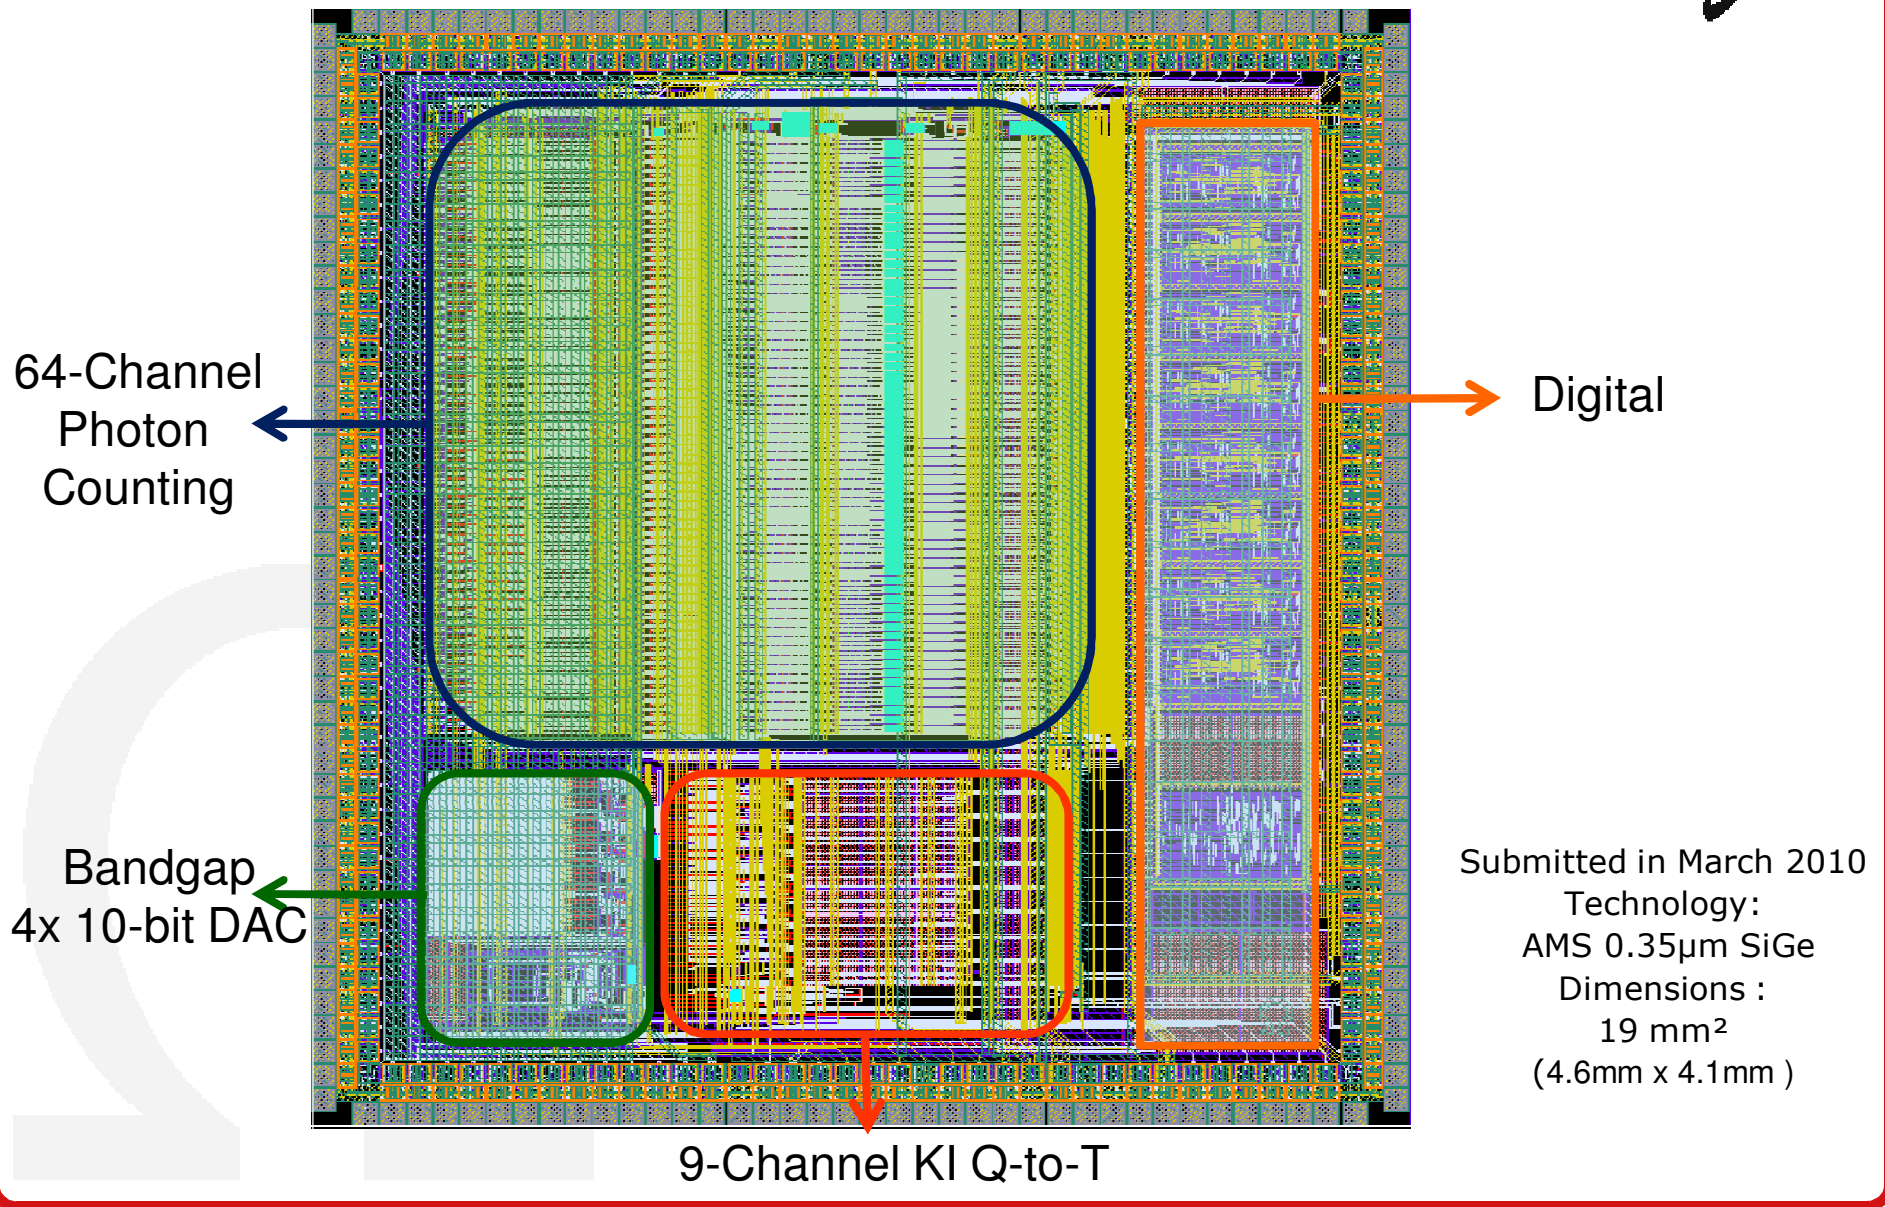

Photon Counting

KI

- 8 identical digital module for Photon Counting
- 1 digital module for KI
- Photon Counting Discriminators => clocking counters
- KI Discriminator => enable sampling
- 9 serial links for data readout + Transmit On signal
- Flip flops TMR in critical area

SPACIROC – Layout

SPACIROC – Test Setup

SPACIROC ASIC

Latest Characterisation Results

- DACs Measurements

4x 10-bit DAC. Range : 0.9 – 2.6V. Linearity: $\pm 0.2\%$. LSB: $\sim 2\text{mV}$

Latest Characterisation Results

Photon Counting:

•Trig_FSU (Baseline):

- Double pulse separation : 30 ns (low noise config)
- Gain = 1mV/fC
- Min input = 30 fC
- Triggering Efficiency RMS = 2.5 DAC unit
- Measured power consumption = 0.4mW/ch

•Trig_PA:

- Double pulse separation : 36 ns
- Gain = 0.32mV/fC (PreAmp settings = 1)
- Min input = 30 fC
- Triggering Efficiency RMS = 1.8 DAC unit
- Measured power consumption = 0.1mW/ch

•Trig_VFS:

- Double pulse separation : 15 ns
- Gain = 1.3mV/fC
- Min input = 60 fC
- Triggering Efficiency RMS = 17 DAC unit
- Measured power consumption = 0.4mW/ch

Trig_FSU 64 Channel Scurves

Trig_PA 64 Channel Scurves

Trig_VFS 64 Channel Scurves

Latest Characterisation Results

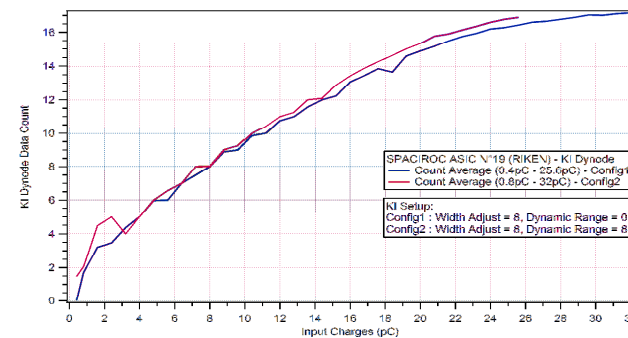

KI:

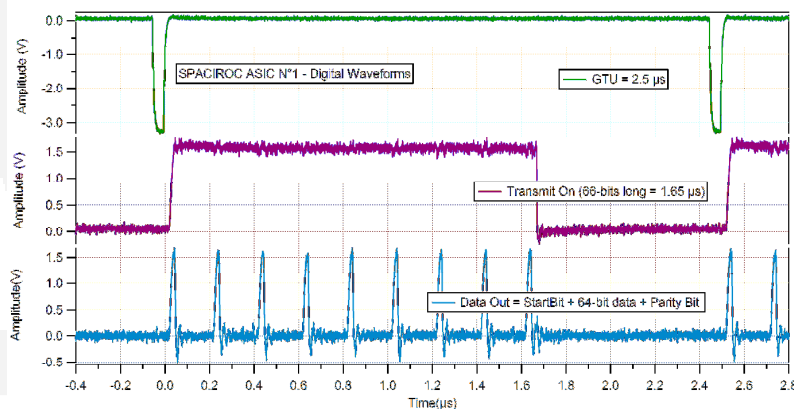

- 8-pixel-sum:
 - Input test: 1.6pC – 250 pC
- Dynode:
 - Input test: 0.8pC – 32 pC
- Fine tuning the settings (RIKEN)

KI 8-Pixel-Sum Measurements

KI Dynode Measurements

ASIC Digital System:

- Startbit, Data, TransmissionOn, Parity Bit
- Data output Vhi-Vlo: 1.5V - 0V

Conclusion

- SPACIROC exhibits good behavior for a first prototype
- Nearly all intended features & functionality are working
- Currently finalising characterisation of the ASIC
- The work for pre-production prototype is underway:
 - Final prototype before mass production
 - Target :
 - ❖ Improve power consumption
 - ❖ Better double pulse separation resolution
 - ❖ Improve KI performances

Summary of Current spec:

Item	Asic Spec
Power Consumption	1.1mW/ch
Photon Counting Minimum Input	30fC
Double pulse separation	30ns
KI 8-pixel-sum Dynamic Range	2pC – 200pC
KI Dynode Dynamic Range	0.8pC - 32pC
Digital module counting rate	50MHz

Thank you for listening !

JEM-EUSO – Overview

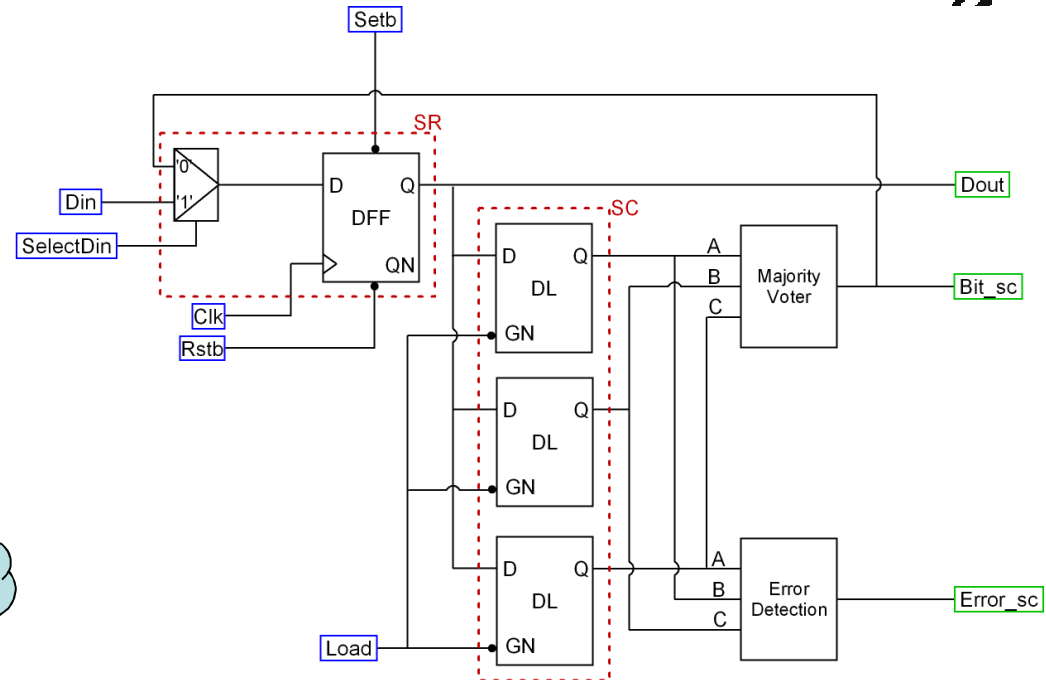

Omega

SPACIROC – Slow Control Cell

Slow control cell:

- 1 Scan DFF + triple Data latch
- Majority voter
- Bit error detection
- Non-destructive data readout
- Bigger layout : SEL protection,...

Layout DFF

Layout Slow Control Cell Spaciroc

Latest Characterisation Results

Omega

- SPACIROC General characteristics:
 - Typ power consumption : 1.1 mW/Ch (40 events/GTU/Ch)
 - TMR Slow Control Cells (898 bits) : Working, Non Destructif Readout
 - 4x 10-bit DACs: Good linearity ($\pm 0.2\%$ Residuals)
 - Bandgap Reference: 2.51V (Stable Room Temp)
- Photon Counting:
 - Trig_PA, Trig_FSU, & Trig_VFS : Working
 - Baseline :
 - Trig_FSU : Preamp + Shaper(FSU) + Discriminator + Digital
 - Best choice in term of design, robustnes & performances
- KI:
 - 8-Pixel-Sum : Working
 - Dynode: Working
- Digital : OK. No major issues.

SPACIROC issues & bugs:

- **Power consumption:**
 - Due to design bugs, unused component can't be turned off.
 - In baseline mode(Trig_FSU), VFS shapers & Trig_PA discris are always ON! Non negligible useless power dissipation.

- **PC: Noise problem:**
 - Digital noise polluting some inputs => uneven noise level for all channels
 - Noise level should be lower without ASIC socket (or COB)

- **PC: Double pulse separation:**
 - Off target for 10 ns. Probably unachievable.
 - Mixed-up between min discris pulse width & Double pulse separation

- **PC : Trig_PA**
 - Expected signal & gain too low compared to simulations
 - Very sensitive to layout parasitic capacitances

Latest Characterisation Results

Omega

SPACIROC issues & bugs:

- **PC**: Trig_VFS:
 - VFS has no power OFF switch!
 - Discr1 has very uneven behaviour due to process disparity

- **KI**: General:
 - Dynamic range & Pulse width parameters are shared between KI 8-Pixel-Sum & KI Dynode.

- **KI** : 8-Pixel-Sum
 - Linearity zone is 75% smaller than simulations
 - Integrated signal swing is 0.7V instead of 1.5V
 - Huge dynamic loss

- **KI**: Dynode
 - Difficulties to inject charges when synchronised to GTU=2.5 μ s
 - Input impedance too big? Input pad limiting signal?? Leakage current???
 - Nearly unresponsive to fast input signal (sub 10ns input pulse)
