Elements for  
DHCAL based  
on THGEMs

H. Natal da Luz  
et al.

- 1 Digital Hadron Calorimetry for ILC
- 2 Thick-Gas Electron Multiplier (THGEM)
- 3 Detector performance
- 4 Integration with KPiX ASIC
- 5 Optimization approaches
- 6 Conclusions and near future work

DHCAL for ILC

THGEM

Detector

KPiX

Optimization

Conclusions

Precision studies of new physics

ILC: Separate W,Z boson masses on event-by-event basis

60%/ $\sqrt{E}$

Best JET resolution with traditional calorimetry

Need 30%/ $\sqrt{E}$

Generally need  $\sigma/E_{jet} \sim 3-4\%$

## Digital calorimetry

associate "hits" with charged tracks, remove hits, measure neutrals in calorimeter using **hits vs. energy**

Particle Flow Algorithms now achieve the required energy resolution!

- Requires thin, efficient, highly segmented, compact, robust medium
- Possible technologies: D-GEM, Micromegas, RPC, **THGEM**

et al.

DHCAL for ILC

THGEM

Detector

KPIX

Optimization

Conclusions

Design within the SiD Detector Concept,  
but also as part of the CALICE collaboration

## SiD

Quadrant View

# New concept for DHCAL: THGEM

Elements for DHCAL based on THGEMs

H. Natal da Luz et al.

## A. White et al UTA

General detector scheme

2 sampling layers (out of 40) with THGEM-based elements

Sampling jets + advanced pattern recognition algorithms  
 → Very **high-precision jet energy** measurement.

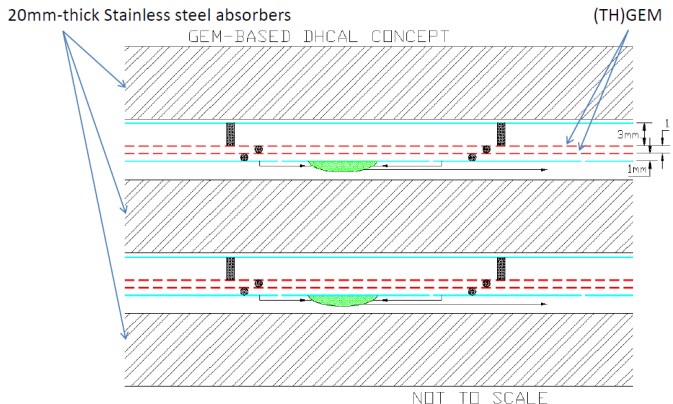

Simulated event w 2 hadronic jets

Reconstructed jet:  
 Simulated energy resolution  
 $\sigma/E_{jet} \sim 3\%$   
 (CALICE)

# THGEM-based Digital Hadron Calorimeter concept

- Elements for DHCAL based on THGEMs
- H. Natal da Luz et al.
- DHCAL for ILC
- THGEM
- Detector
- KPIX
- Optimization
- Conclusions

## Aims

- Thickness of sensitive region: 6–8 mm, including readout electronics.
- 95 % efficiency;
- up to 1.7 particles/pad overlap is acceptable.

# Thick Gas Electron Multiplier (THGEM)

~ 10-fold expanded GEM

Thickness 0.5-1mm

drilled  
 etched

**THGEM advantage for DHCAL:**  
**SIMPLE, ROBUST, LARGE-AREA**  
**Cheap: Printed-circuit technology**  
**Digital counting →**  
**gain fluctuations not important**

THGEM Recent review  
 NIMA 598 (2009) 107

**Double-THGEM: 10-100 higher gains**

- Robust, if discharge no damage
- Effective **single-electron** detection
- **Few-ns** RMS time resolution
- **Sub-mm** position resolution
- **>MHz/mm<sup>2</sup>** rate capability
- Broad pressure range: **1mbar - few bar**

- Higher gain in Ne mixtures  
**but:** lower ionization —  $n_{\text{tot}} \sim 40 \text{ e/MIP}$
- 2-THGEM: higher gains/lower HV  
**but:** too thick.

Elements for

et al.

DHCAL for ILC

THGEM

Detector

KPiX

Optimization

Conclusions

## THGEM chamber

- THGEM area:  $10 \times 10 \text{ cm}^2$ ;
- Gas volume:  $\sim 280 \times 180 \times 32 \text{ mm}^3$ ;
- Gas: Ne/CH<sub>4</sub> (95:5)  
(non-flammable);
- Single THGEM, gaps: 3/2 mm (d/i)  
or  
Double THGEM, gaps: 3/2/2 mm  
(d/t/i).

Integration with KPiX readout electrode in course.

et al.

DHCAL for ILC

THGEM

Detector

KPIX

Optimization

Conclusions

Cosmic data, standard analog electronics.  
Operation at huge gain ( $\sim 65\text{k}$ )!

- RD51 test beam facility at CERN (SPS/H4),
- Several geometries tested.
- System triggered with 3  $10 \times 10 \text{ cm}^2$  scintillators, plus one small  $1 \text{ cm}^2$  to select different smaller regions on THGEM area.

## PIONS

## MUONS

**Measured very low discharge rates even with pions @ rates  $\gg$  ILC**

THGEM: 0.4mm  
Gain: 1200-1400

- Muons and pions easily measured, but charge signals very low;
- Spark rate was fine, but KPiX might need higher signals.

# Beam results - efficiency

Elements for  
DHCAL based  
on THGEMs

H. Natal da Luz  
et al.

DHCAL for ILC

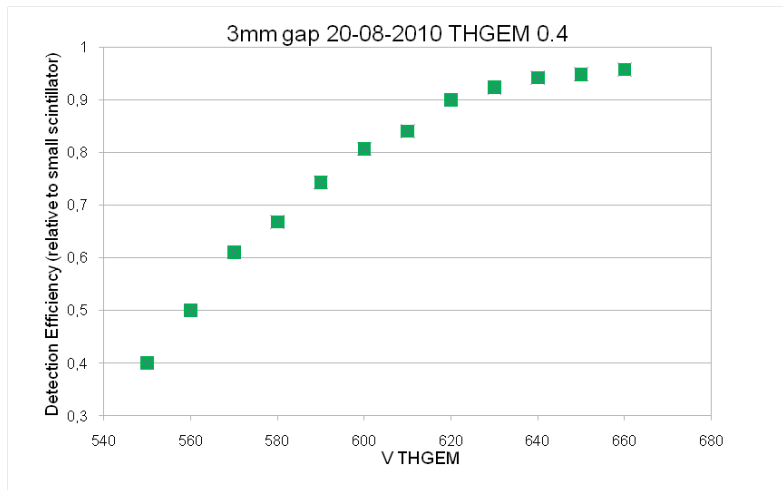

THGEM

Detector

KPIX

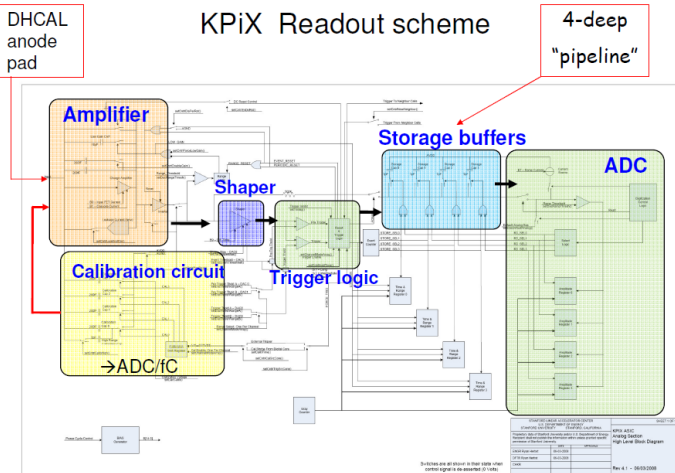

Optimization

Conclusions

Maximum detection efficiency ( $\epsilon = 96\%$ ) was reached very early, even with a small drift gap.

# KPiX charge readout chip

- Developed for Si/W ECAL at SLAC,
- KPiX 9: 512 13-bit ADC (our THGEMs only use 64),
- Self-Calibrating (distributions can immediately be given in fC).

DHCAL for ILC

THGEM

Detector

KPiX

Optimization

Conclusions

FPGA, interface and KPiX ASIC board

64 pad electrodes with KPiX ASIC behind.

- 64 pads in a  $8 \times 8 \text{ cm}^2$  matrix.
- Communication with a PC by USB through interface and FPGA boards.
- Very low efficiency ( $\sim 4\%$ ) due to ILC synchronized timing structure.

- H. Natal da Luz et al.
- DHCAL for ILC
- THGEM
- Detector
- KPiX**
- Optimization
- Conclusions

- Integral of charge in each channel.
- Each pad has 1 cm<sup>2</sup>.

Elements for  
DHCAL based  
on THGEMs

H. Natal da Luz  
et al.

DHCAL for ILC

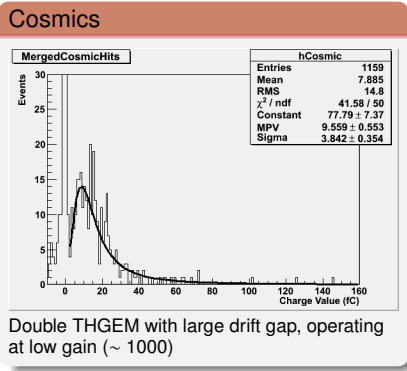

THGEM

Detector

KPiX

Optimization

Conclusions

- Electronics very sensitive to sparks. Got damaged before end of tests in beam.
- Problem partially solved, but sparks still originate glitches in the LV power circuit and strange things happen in KPiX (latch up in some channels and software crashes).

# Two different fronts to keep optimizing

Elements for  
DHCAL based  
on THGEMs

H. Natal da Luz  
et al.

DHCAL for ILC

THGEM

Detector

KPIX

Optimization

Conclusions

## Improving KPIX robustness against sparks

- application of protection resistors and diodes in the circuit to prevent latching up of channels due to sparks,
- Application of inductances in the LV power supply lines to avoid propagation of the sparks to the interface and FPGA boards.

## Minimize spark probability

- THGEMs used in more recent works seem to have a lower discharge probability,
- Noise optimization might allow to work at lower gain,
- Use resistive well geometry (see next slides).

## Advantages

- No induction gap
- Ground on both external electrodes
- Spark-protection of electronics

Under investigations at Weizmann

Elements for  
DHCAL based  
on THGEMs

H. Natal da Luz  
et al.

DHCAL for ILC

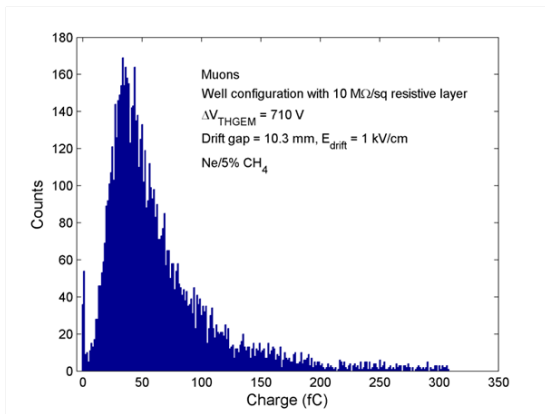

THGEM

Detector

KPiX

Optimization

Conclusions

- Acquisition with standard electronics chain (KPiX was not working);
- Very high gain with no sparks ( $\sim 5600$ );
- Charge pulses more than enough for KPiX;
- Still unclear how it works when reading from separate pads.

## Conclusions

- Very promising structure, with a low cost per unit area,
- Results have shown that it is possible to see MIPs within 6 mm,
- Integration with KPiX about to be achieved thanks to close cooperation with SLAC.

## Near future

- Establish working conditions of THGEM + KPiX in RD51 test beam,
- Combine with RD51 GEM/MicroMegas tracker information to determine multiplicity,
- Test chamber performance in the presence of hadronic showers.
