Outline

- Hadron Calorimetry at CLIC: Competing Requirements
- The Time Structure of Hadronic Showers
- First measurements in a Tungsten HCAL
 - The T3B Setup
 - First Results
- Summary & Outlook

Hadron Calorimetry at CLIC

- CLIC: A 3 TeV e^+e^- linear collider
The key CLIC feature: High Energy!
 - 3 TeV energy means in principle up to 1.5 TeV jets

Shower containment and leakage is a crucial issue

- ⇒ A (very) deep hadron calorimeter is needed
- ⇒ Use compact absorbers to limit the detector radius: Tungsten a natural choice

Hadron Calorimetry at CLIC

- CLIC: A 3 TeV e^+e^- linear collider
The key CLIC feature: High Energy!
 - 3 TeV energy means in principle up to 1.5 TeV jets

Shower containment and leakage is a crucial issue

- ⇒ A (very) deep hadron calorimeter is needed
- ⇒ Use compact absorbers to limit the detector radius: Tungsten a natural choice
- Key challenge (linked to high energy and machine-specific issues): Background
 - $\gamma\gamma \rightarrow$ hadrons substantial:
 - ~ 12 hadrons/bunch crossing in the barrel region
(4 GeV / bunch crossing) [up to 50 hadrons /
50 - 60 GeV barrel + endcap + plug calorimeters]
 - extreme bunch crossing rate: every 0.5 ns
- ⇒ Very good time resolution in all detectors important to limit impact of background!

Hadronic Showers: Complex (Time) Structure

- Hadronic showers have a rich substructure:

Hadronic Showers: Complex (Time) Structure

- Hadronic showers have a rich substructure:

instantaneous, detected via energy loss of electrons and positrons in active medium

Hadronic Showers: Complex (Time) Structure

- Hadronic showers have a rich substructure:

instantaneous, detected via energy loss of electrons and positrons in active medium

- instantaneous component: charged hadrons detected via energy loss of charged hadrons in active medium
- delayed component: photons, neutrons, protons from nuclear de-excitation, detected via e^+e^- , momentum transfer to protons in hydrogenous active medium, energy loss, contributions from time of flight of low energy particles

Hadronic Showers: Complex (Time) Structure

- Hadronic showers have a rich substructure:

instantaneous, detected via energy loss of electrons and positrons in active medium

- instantaneous component: charged hadrons detected via energy loss of charged hadrons in active medium
- delayed component: photons, neutrons, protons from nuclear de-excitation, detected via e^+e^- , momentum transfer to protons in hydrogenous active medium, energy loss, contributions from time of flight of low energy particles

- ⇒ Importance of delayed component strongly depends on target nucleus
- ⇒ Sensitivity to time structure depends on the choice of active medium

Hadronic Showers: Complex (Time) Structure

- Hadronic showers have a rich substructure:

instantaneous, detected via energy loss of electrons and positrons in active medium

Detector optimization and performance studies rely on Geant4:
How well do the simulations reproduce the time structure
of the response in the CLIC HCAL?

energy

- delayed component: photons, neutrons, protons from nuclear de-excitation, detected via e^+e^- , momentum transfer to protons in hydrogenous active medium, energy loss, contributions from time of flight of low energy particles

- ⇒ Importance of delayed component strongly depends on target nucleus
- ⇒ Sensitivity to time structure depends on the choice of active medium

T3B: An Experiment for a First Study of the Time Structure

- The CALICE Scintillator-Tungsten HCAL - A CLIC physics prototype
 - 30 layers with 10 mm Tungsten (93% W, 5% Ni, 2% Cu, density 17.6 g/cm^3) absorber
 - Active elements from CALICE AHCAL: 5 mm thick scintillator tiles, read out by SiPMs (no time information available)

T3B: An Experiment for a First Study of the Time Structure

- The CALICE Scintillator-Tungsten HCAL - A CLIC physics prototype
 - 30 layers with 10 mm Tungsten (93% W, 5% Ni, 2% Cu, density 17.6 g/cm^3) absorber
 - Active elements from CALICE AHCAL: 5 mm thick scintillator tiles, read out by SiPMs (no time information available)
- T3B (Tungsten Timing Test Beam)
 - Goal: Measure the time structure of the signal within hadronic showers in a Tungsten calorimeter with scintillator readout
 - Use a (very) small number of scintillator cells, read those out with high time resolution
 - Record signal over long time window:
 - ~ $2 \mu\text{s}$ to sample the full shower development

T3B: An Experiment for a First Study of the Time Structure

- The CALICE Scintillator-Tungsten HCAL - A CLIC physics prototype
 - 30 layers with 10 mm Tungsten (93% W, 5% Ni, 2% Cu, density 17.6 g/cm^3) absorber
 - Active elements from CALICE AHCAL: 5 mm thick scintillator tiles, read out by SiPMs (no time information available)
- T3B (Tungsten Timing Test Beam)
 - Goal: Measure the time structure of the signal within hadronic showers in a Tungsten calorimeter with scintillator readout
 - Use a (very) small number of scintillator cells, read those out with high time resolution
 - Record signal over long time window:
 - ~ $2 \mu\text{s}$ to sample the full shower development

⇒ First information on time structure, possibility for comparisons to Geant4, but:
no complete “4D” shower reconstruction!

T3B Technology: Scintillators and Photon Sensors

- Important features for timing measurement:
 - Fast response (good time resolution!)
 - Large signal (allows detection of small individual energy deposits)

Fiberless coupling of photon sensor to scintillator: Eliminate time constant of WLS

- ▶ Requires blue sensitive photon sensors
- ▶ Requires special shaping of coupling position to obtain uniform response over tile

NIM A620, 196 (2010)

~ x2 faster response
without WLS

T3B Technology: DAQ

- Key requirements:
 - Fast sampling to allow for single photon resolution: ~ 1 GHz or more
 - Long acquisition window per event: $2 \mu\text{s}$ or more
 - Fast trigger rate: faster than the CALICE HCAL, $>$ a few kHz

T3B Technology: DAQ

- Key requirements:
 - Fast sampling to allow for single photon resolution: ~ 1 GHz or more
 - Long acquisition window per event: $2 \mu\text{s}$ or more
 - Fast trigger rate: faster than the CALICE HCAL, $>$ a few kHz
- Adopted solution for T3B: PicoScope 6403
 - 1.25 GHz sampling for 4 channels per unit
 - 1 GB buffer memory (shared between channels)
 - Burst trigger mode: Maximum rate determined by window length:
 ~ 500 kHz for $2 \mu\text{s}$ acquisition window
 - 8 bit vertical resolution
 - Control & Readout via USB

The T3B Setup

- 15 $3 \times 3 \text{ cm}^2$ scintillator cells, sampling the radial extent of the shower

beam axis
through cell 0

The T3B Setup

- 15 $3 \times 3 \text{ cm}^2$ scintillator cells, sampling the radial extent of the shower

beam axis
through cell 0

Stand-alone system:

- Installed downstream of CALICE WHCAL, depth $\sim 4 \lambda$
- Each cell read out with 1.25 GS oscilloscope, 2.4 μs sampling time per event
- Calibration triggers on dark noise between spills

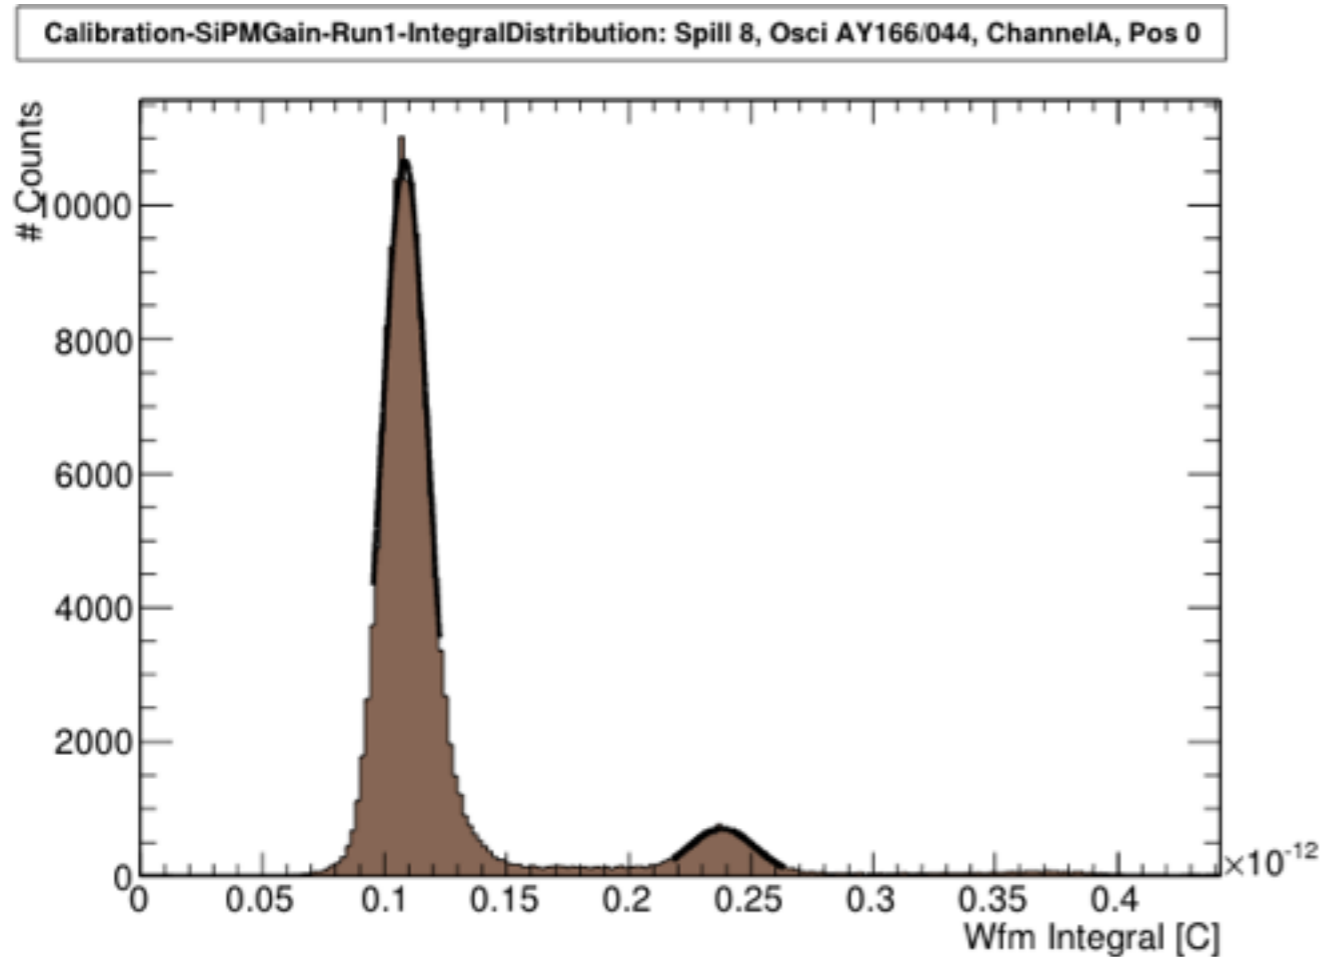

Synchronization with CALICE

- Triggered by CALICE trigger - common analysis possible in the future

T3B Scintillator Tiles - Performance Studies

- Gain calibration of photon sensors: dark noise

T3B Scintillator Tiles - Performance Studies

- Gain calibration of photon sensors: dark noise

Calibration-SiPMGain-Run1-IntegralDistribution: Spill 8, Osci AY166/044, ChannelA, Pos 0

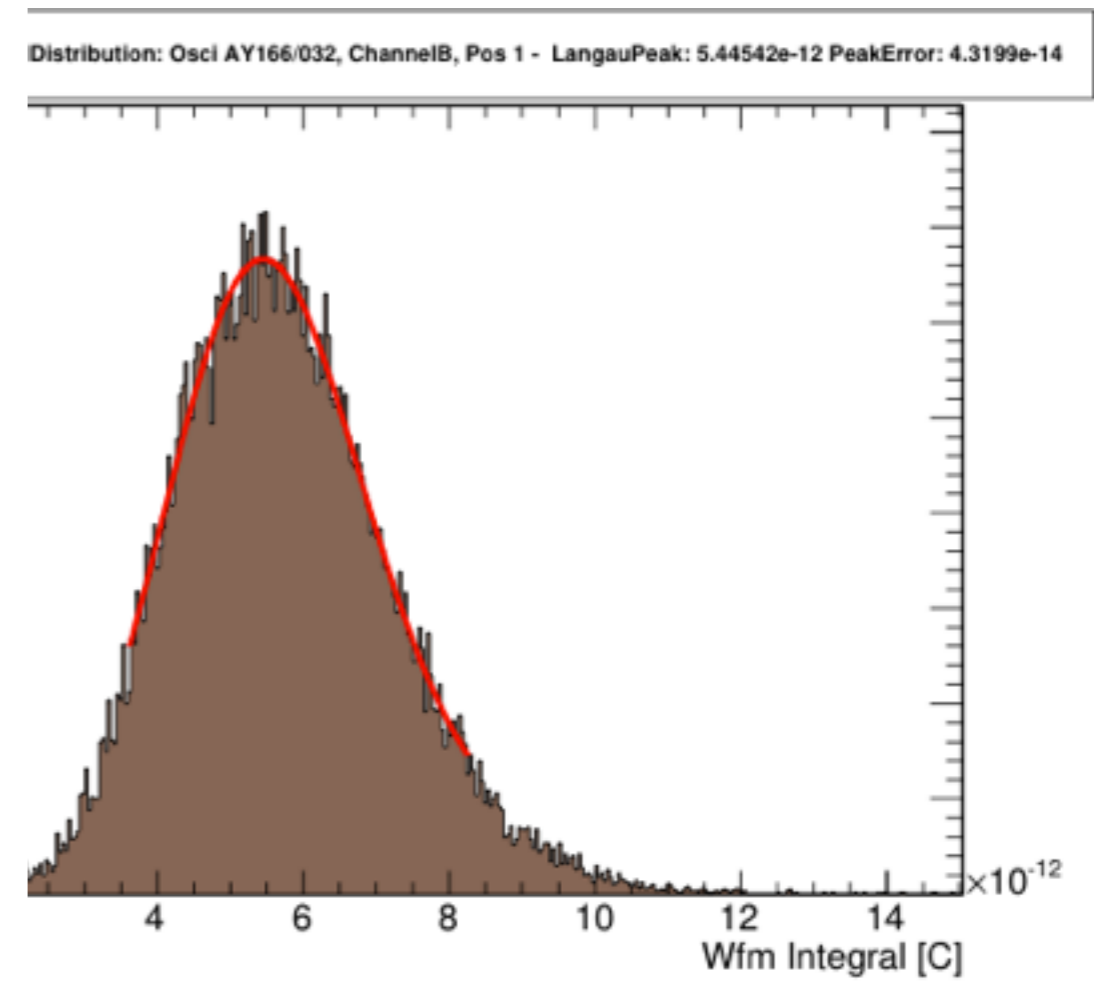

MipPeak-Run59-IntegralDistribution: Osci AY166/032, ChannelB, Pos 1 - LandauPeak: 5.44542e-12 PeakError: 4.3199e-14

- Calibration of tile response to charged particles: Penetrating electrons from ^{90}Sr
Calibration factor (most probable value) extracted from Landau conv. with Gaussian fit

T3B Scintillator Tiles - Performance Studies

- Gain calibration of photon sensors: dark noise

: Penetrating electrons from ^{90}Sr

calculated from Landau conv. with

Gaussian fit

- Distribution of response over sample of T3B tiles: 10% RMS variation

Data Analysis - Technique

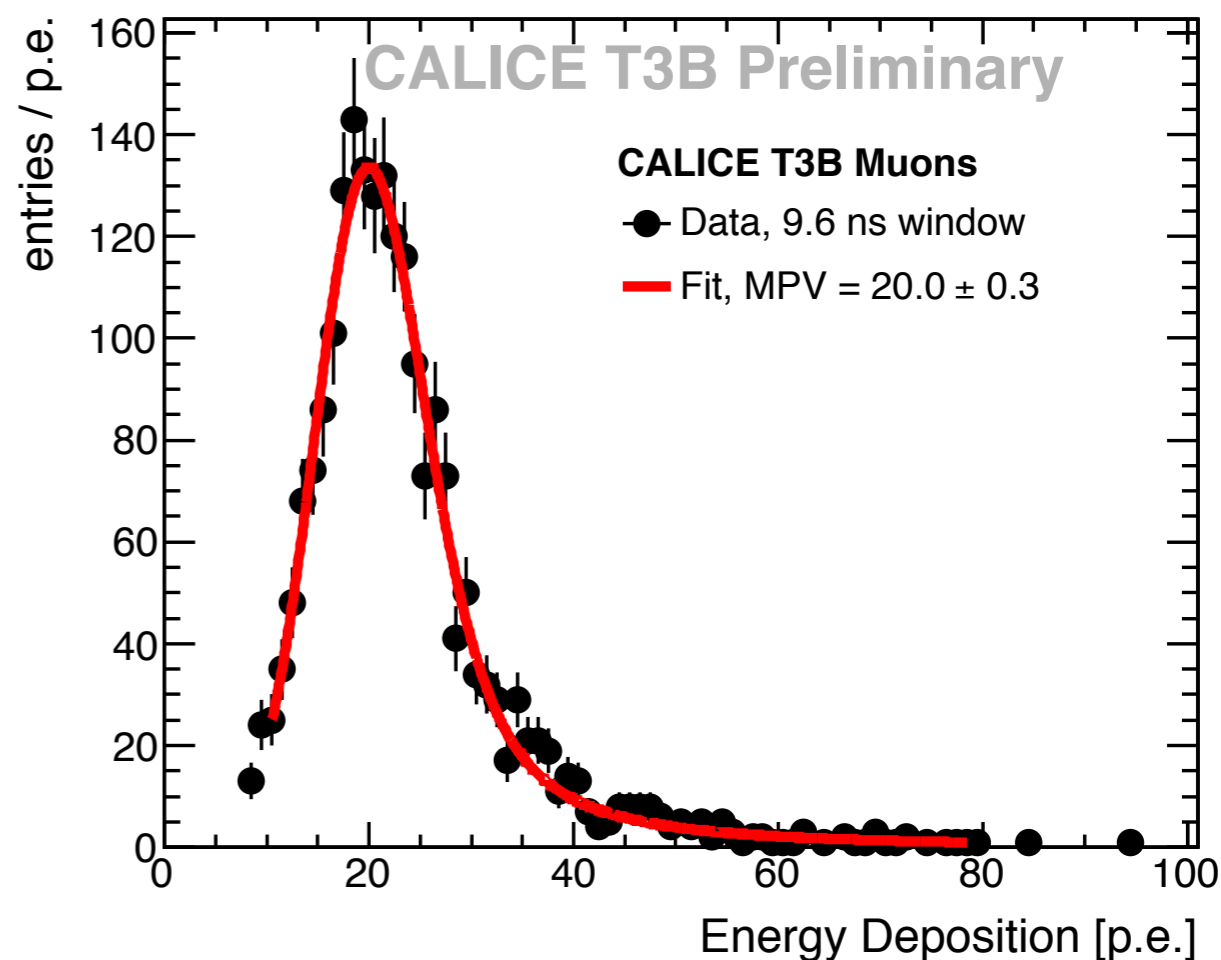

- For each channel, a complete waveform with 3000 samples (800 ps /sample) is saved
- Waveform decomposed into individual photon signals, using averaged 1 p.e. signals
 - Average 1 p.e. signal taken from calibration runs between spills, refreshed every 5 minutes: Continuous automatic gain calibration

- Reconstruction of the time of each photo-electron

First Results - Muons

- Energy of muons reconstructed in the central T3B tile
 - Full reconstruction with waveform decomposition
 - Used to calibrate the response for tile 0, consistent result for tile 1 - only small cell-to-cell variation expected

- Two integration times: Short time window rejects a significant fraction of SiPM afterpulses

First Results - Muon Timing

- Present analysis: determining the Time of First Hit
 - minimum of 8 p.e. (~ 0.4 MIP) within 9.6 ns

Time of First Hit for Muons:

- Response to instantaneous energy deposit

First Results - Muon Timing

- Present analysis: determining the Time of First Hit
 - minimum of 8 p.e. (~ 0.4 MIP) within 9.6 ns

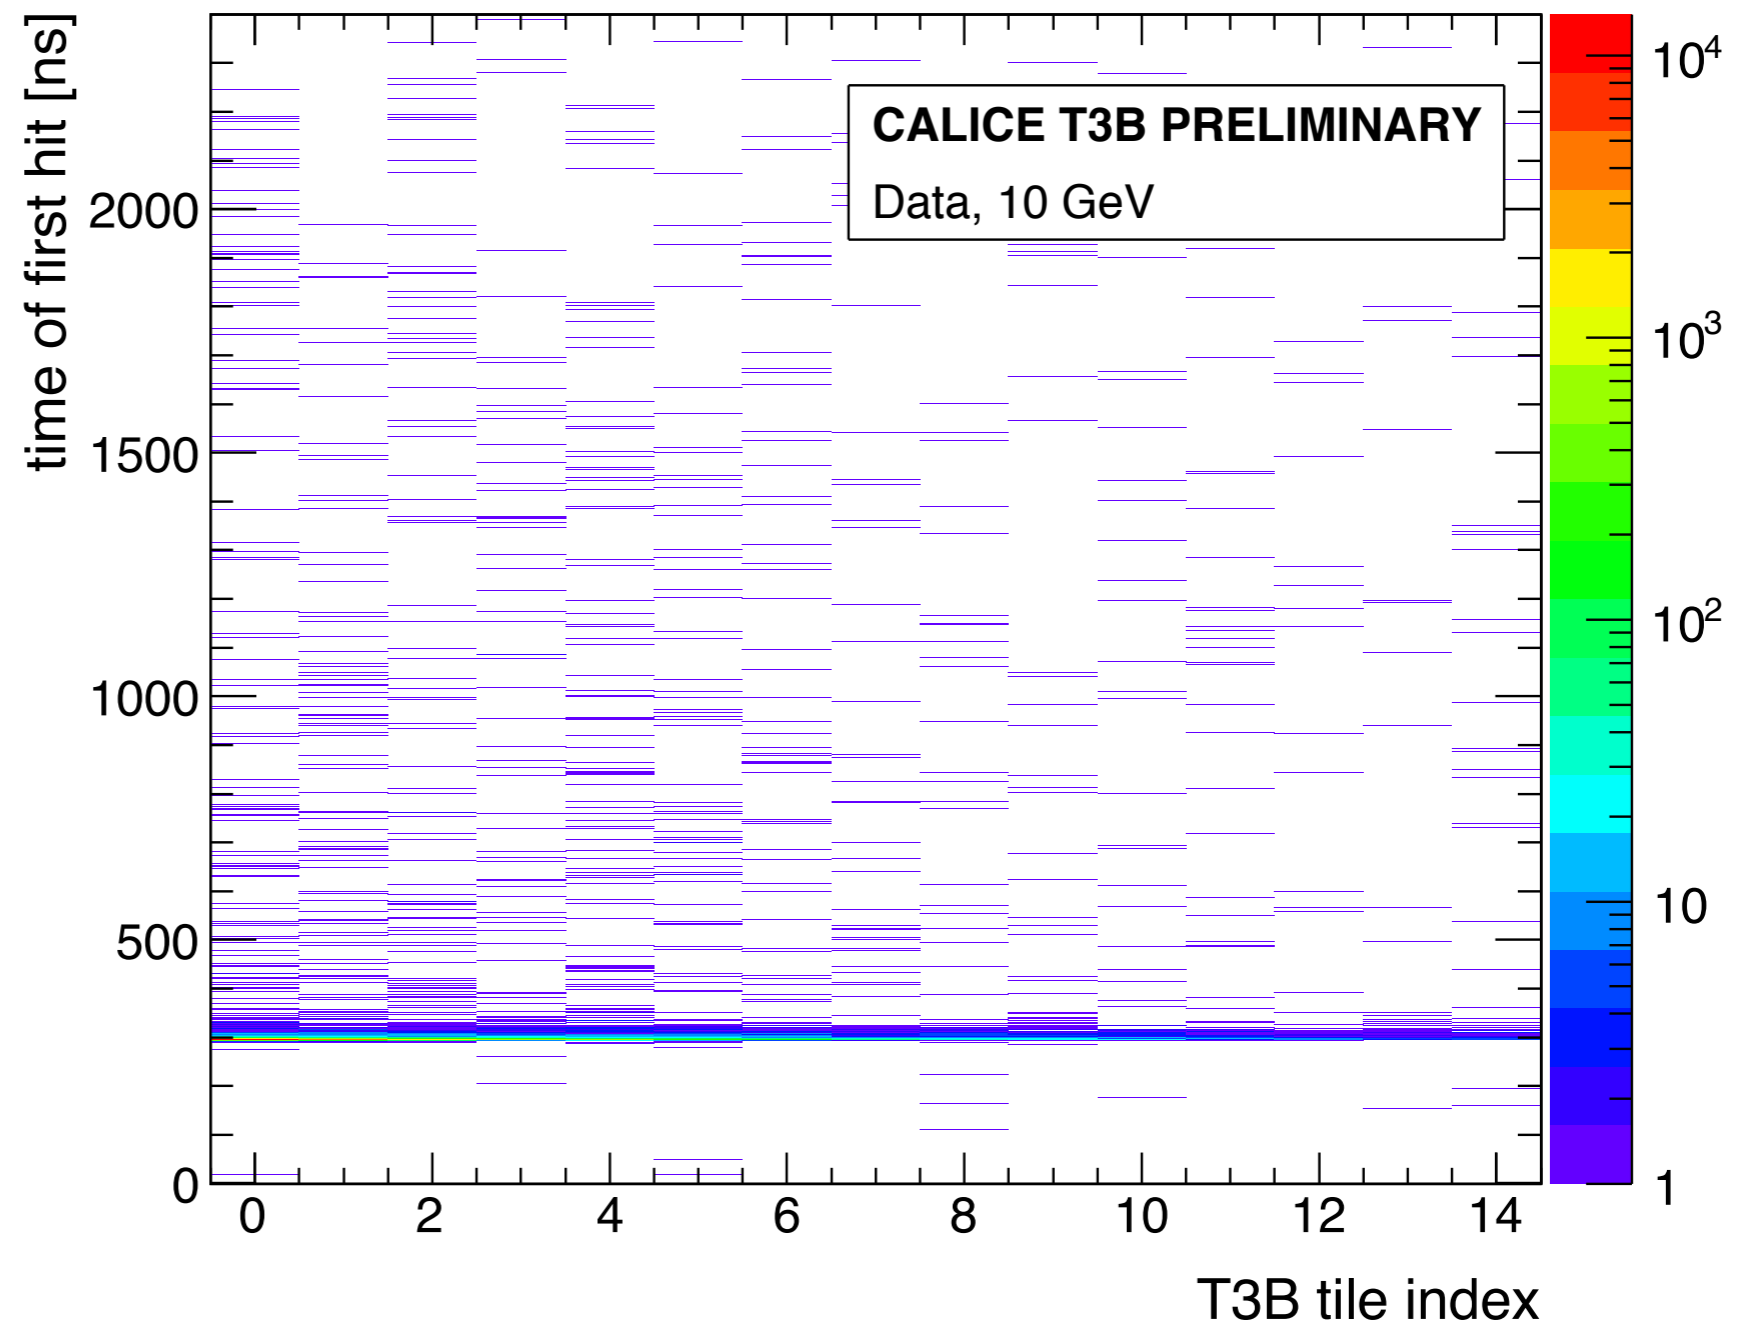

Time of First Hit for Muons:

- Response to instantaneous energy deposit
- Time resolution (including trigger): ~ 800 ps
- Consistent with simulations including time smearing

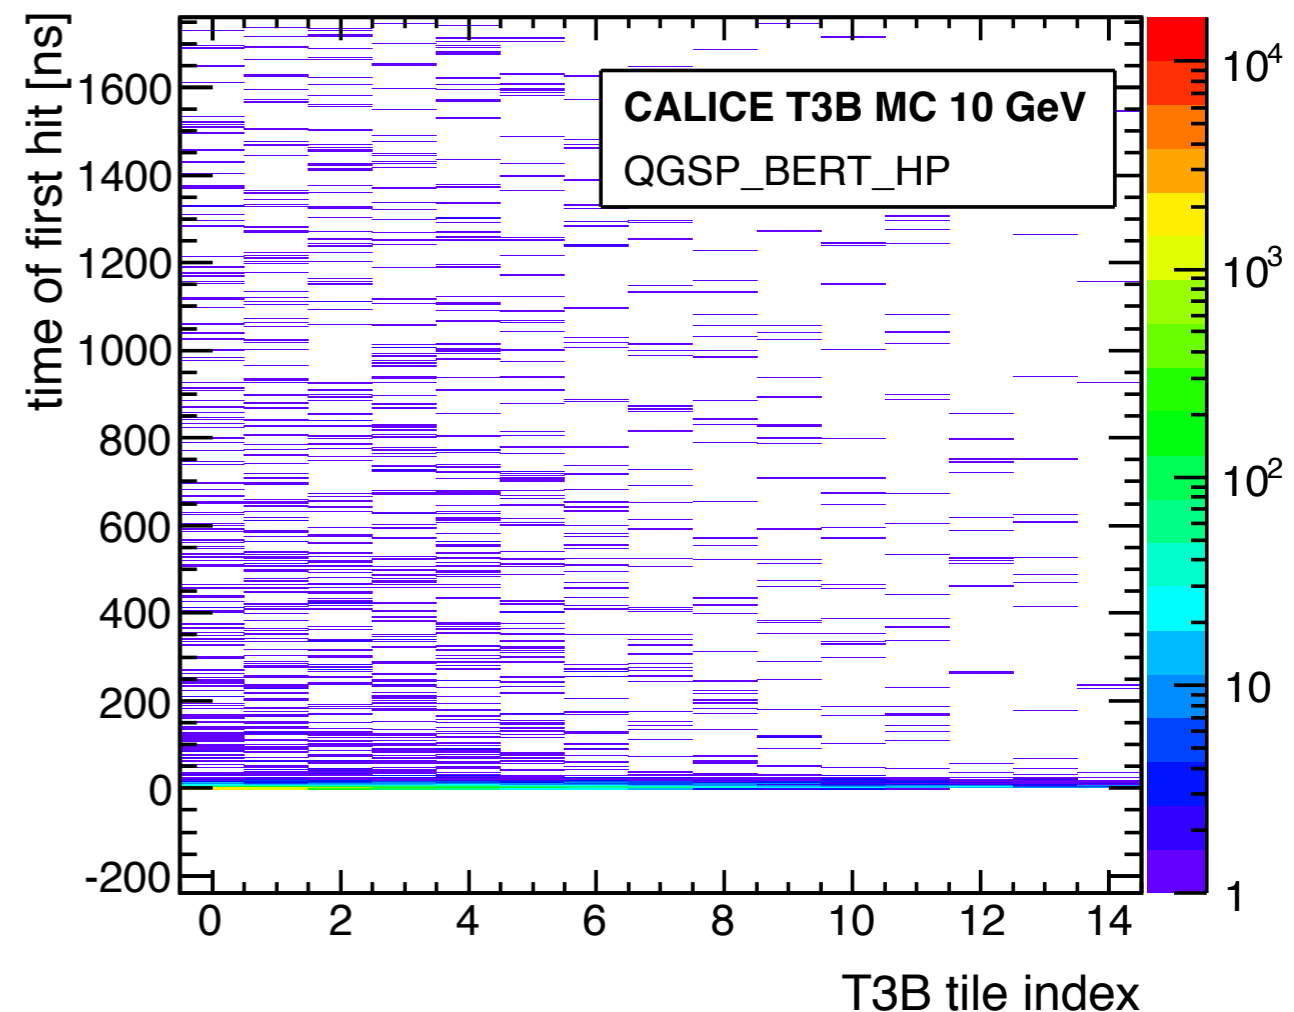

First Results - Pion Data

- Data taken in CALICE WHCAL Testbeam at CERN PS
 - Current analysis: Highest energy - 10 GeV π^-
 - Time of First Hit

Time of First Hit in Simulations

- Simulations using smeared photon distributions
- Same analysis procedure as real data
- Two physics lists:
 - QGSP_BERT: LHC standard, used for CLIC detector studies
 - QGSP_BERT_HP: Variant with high precision neutron tracking

Data & Simulations - First Results

Central T3B cell:
Distribution of the
Time of First Hit

- QGSP_BERT shows a pronounced tail of late energy depositions
- Data agrees better with QGSP_BERT_HP - Reduced activity beyond 20 ns

Data & Simulations - First Results

Compact Comparison: Mean Time of First Hit

- calculated in a time window of 200 ns (-10 ns to 190 ns from maximum in tile 0)

- Data consistently described by QGSP_BERT_HP
 - QGSP_BERT deviates strongly

Data & Simulations - First Results

Compact Comparison:

Mean Time of First Hit

- calculated in a time window of 200 ns (-10 ns to 190 ns from maximum in tile 0)

- Data consistently described by QGSP_BERT_HP

- QGSP_BERT deviates strongly

⇒ High precision neutron tracking or other means to suppress excessive late energy depositions necessary to describe observed time structure in T3B

Summary & Outlook

- Time resolution is important at CLIC: High hadron background combined with 2 GHz bunch crossing frequency
- Hadronic showers are not instantaneous: Limits to the time resolution of the hadronic calorimeters
- CALICE T3B is a dedicated experiment to provide first measurements of the time structure in a scintillator-tungsten HCAL
 - Scintillator tiles with direct SiPM readout - Good cell-to-cell response uniformity
 - Readout with USB oscilloscopes: Long time windows, high trigger rates
 - Analysis technique based on waveform decomposition - Automatic gain calibration with dark noise
- First results from PS beam period: Moderate amount of late-starting hits observed: Consistent with Geant4 simulations using QGSP_BERT_HP

Backup

Simulations

- Geant 4.9.3.p01, Simplified simulation setup:
 - 31 layer HCAL, with 1 cm W + 1 mm Steel absorber
 - CALICE AHCAL cassette (2 x 2 mm Steel, 5 mm scintillator + PCB, cables, air)
 - Use T3B as the last layer of the setup
- Simulation of the time structure:
 - record the time and energy deposit of each Geant4 step in the T3B scintillator volume
 - bin in 800 ps time bins, convert to number of photons according to the energy in the bin
 - smear the time distribution of the photons according to observed time distribution of muon signals
 - ad-hoc fit with a Landau: $\sigma \sim 1.3$ ns
