## Abstract [Top](#)

Open Access (OA) is a model for publishing scholarly peer reviewed journals, made possible by the Internet. The full text of OA journals and articles can be freely read, as the publishing is funded through means other than subscriptions. Empirical research concerning the quantitative development of OA publishing has so far consisted of scattered individual studies providing brief snapshots, using varying methods and data sources. This study adopts a systematic method for studying the development of OA journals from their beginnings in the early 1990s until 2009. Because no comprehensive index of OA articles exists, systematic manual data collection from journal web sites was conducted based on journal-level data extracted from the Directory of Open Access Journals (DOAJ). Due to the high number of journals registered in the DOAJ, almost 5000 at the time of the study, stratified random sampling was used. A separate sample of verified early pioneer OA journals was also studied. The results show a very rapid growth of OA publishing during the period 1993–2009.

## Welcome to the Open Access Scholarly Publishers Association, OASPA.

OASPA offers a forum for bringing together the entire community of Open Access journal publishers.

**Our mission** is to represent the interests of Open Access (OA) journal and book publishers globally in all scientific, technical and scholarly disciplines. This mission will be carried out through exchanging information, setting standards, advancing models, advocacy, education, and the promotion of innovation.

Through a shared interest in developing appropriate business models, tools and standards to support OA publishing, we can ensure a prosperous and sustainable future to the benefit of our members and the scholarly communities they serve. OASPA would like to thank **SPARC Europe** for its support during our initial phase of operation.

**Keep up to date on OASPA via our Blog**

We hope you will **join us** as an OASPA Member!

### Announcements

**The 3rd Conference on Open Access Scholarly Publishing is now open for registration!**

**The 2nd Conference for Open Access Scholarly Publishers (COASP), was held at the President Hotel, Prague, Czech Republic 22-24 August 2010. You can view the conference sessions at:**

## Abstract [Top](#)

### Background

The best European locality for complete Eocene mammal skeletons is Grube Messel, near Darmstadt, Germany. Although the site was surrounded by a para-tropical rain forest in the Eocene, primates are remarkably rare there, and only eight fragmentary specimens were known until now. Messel has now yielded a full primate skeleton. The specimen has an unusual history: it was privately collected and sold in two parts, with only the lesser part previously known. The second part, which has just come to light, shows the skeleton to be

## BMJ Open – now accepting submissions

### Instructions for authors

#### EDITORIAL POLICIES

*BMJ Open* is an open access journal dedicated exclusively to publishing medical research. The journal aims to provide rapid publication of research across a range of medical disciplines and

the  
art  
pro  
Su  
pul  
alo

#### PEER REVIEW PROCESS

All articles published in *BMJ Open* will have been sent for external, open peer review. Reviewers will not be asked to judge for importance or breadth of appeal. Readers will be able to make these judgements for themselves. We recommend you use our instructions for reviewers as a

Articles should not be under review, or submitted for review, with any other journal when submitted to *BMJ Open*. This includes other BMJ Group journals.

Authors retain copyright; articles are published under a Creative Commons licence.

#### Article processing charges

*BMJ Open* levies an article processing charge that reflects the true cost of the services provided. The charges (inclusive of VAT where applicable) are: £1200 (UK/RoW); €1500 (Eurozone); US\$1500(US). Charges for publishing a study protocol are 50% of the research article charge; a 50% discount will then also be available to the protocol's authors to publish the subsequent research findings in the journal, provided the results are submitted within a reasonable time from completion of the research.

There are no submission or page charges, and no colour charges.

## SAGE launches new open access publication for the Social Sciences *SAGE Open to launch Spring 2011*

Los Angeles CA (November 17, 2010) – SAGE, the world's leading independent academic and professional publisher today announced the launch of **SAGE Open**: a new publication to support open access publishing in the social and behavioral sciences and the humanities.

**SAGE Open** will publish peer-reviewed original research and review articles in an interactive, open access format. The journal will offer authors quick review and decision times; a speedy, continuous-publication format; and global distribution for their research via the SAGE Journals Online platform. The articles will also be guaranteed professional copyediting and typesetting.

The publication supports the growing number of authors who require their articles to be freely available on publication, either because of personal preference or because of university or government mandates.

Unlike traditional journals, **SAGE Open** will not limit content due to page budgets or thematic significance. Rather it will accept articles solely on the basis of the quality of the research, evaluating the scientific and research methods of each article for validity.

"SAGE's position as a global leader in social science publishing gives authors submitting their work to **SAGE Open** an assurance of high quality," said Jayne Marks, Vice President and Editorial Director for SAGE's Library Information Group. "We will be creating an advisory board consisting of discipline leaders and a large editorial board of subject experts to ensure high quality publication."

**SAGE Open** will also include several enhanced features to give readers greater power to determine the significance of articles published, with usage metrics, commenting features, subject categories, article ranking and recommendations.

"SAGE has a long history of supporting and nurturing new interdisciplinary fields of research," said Bob Howard, Director of Social Science Journals. "By covering multiple disciplines in one place, we hope that **SAGE Open** will also facilitate the discovery of the connections between papers, whether within or between disciplines."

For more information, visit <http://www.sageopen.com>.

## Scientific Reports — a new era in publishing

Online and open access, *Scientific Reports* is a brand new primary research publication from the publishers of *Nature*, covering all areas of the natural sciences — biology, chemistry, physics and earth sciences.

*Scientific Reports* exists to facilitate the rapid peer review and publication of research that is of interest to specialists within any given field in the natural sciences, without barriers to access.

*Scientific Reports* is:

- Fast — rapid review and publication
- Rigorous — peer review by at least one member of the academic community
- Open — articles are freely available to all and authors retain copyright
- Visible — enhanced browsing and searching to ensure your article is noticed

- NPG resources**
- Biotechnology
- Cancer
- chemistry@nature
- Development
- Drug Discovery
- Earth Sciences
- Evolution & Ecology
- Genetics
- Immunology
- Materials

### Criteria for publication

[top](#)

To be published in *Scientific Reports*, a paper must be technically sound. It will be the responsibility of the Editorial Board Member to ensure all papers meet this criterion via the peer-review process. Judgments about the importance of a paper will be made by the scientific community after publication.

## Abstract [Top](#)

Brains are usually described as input/output systems: they transform sensory input into motor output. However, the motor output of brains (behavior) is notoriously variable, even under identical sensory conditions. The question of whether this behavioral variability merely reflects residual deviations due to extrinsic random noise in such otherwise deterministic systems or an intrinsic, adaptive indeterminacy trait is central for the basic understanding of brain function. Instead of random noise, we find a fractal order (resembling Lévy flights) in the temporal structure of spontaneous flight maneuvers in tethered *Drosophila* fruit flies. Lévy-like probabilistic behavior patterns are evolutionarily conserved, suggesting a general neural mechanism underlying spontaneous behavior. *Drosophila* can produce these patterns endogenously, without any external cues. The fly's behavior is controlled by brain circuits which operate as a nonlinear system with unstable dynamics far from equilibrium. These findings suggest that both general models of brain function and autonomous agents ought to include biologically relevant nonlinear, endogenous behavior-initiating mechanisms if they strive to realistically simulate biological brains or out-compete other agents.

## Clickstream Data Yields High-Resolution Maps of Science

by: [Johan Bollen](#), [Herbert Van de Sompel](#), [Aric Hagberg](#), [Luis Bettencourt](#), [Ryan Chute](#), [Marko A Rodriguez](#), [Lyudmila Balakireva](#)

*PLoS ONE*, Vol. 4, No. 3. (11 March 2009), e4803.

### ▼ Abstract

“ <sec> <title>Background</title> <p>Intricate maps of science have been created from citation data to visualize the structure of scientific activity. However, most scientific publications are now accessed online. Scholarly web portals record detailed log data at a scale that exceeds the number of all existing citations combined. Such log data is recorded immediately upon publication and keeps track of the sequences of user requests (clickstreams) that are issued by a variety of users across many different domains. Given these advantages of log datasets over citation data, we investigate whether they can produce high-resolution, more current maps of science.</p></sec><sec> <title>Methodology</title> <p>Over the course of 2007 and 2008, we collected nearly 1 billion user interactions recorded by the scholarly web portals of some of the most significant publishers, aggregators and institutional consortia. The resulting reference data set covers a significant part of world-wide use of scholarly web portals in 2006, and provides a balanced coverage of the humanities, social sciences, and natural sciences. A journal clickstream model, i.e. a first-order Markov chain, was extracted from the sequences of user interactions in the logs. The clickstream model was validated by comparing it to the Getty Research Institute's Architecture and Art Thesaurus. The resulting model was visualized as a journal network that outlines the relationships between various scientific domains and clarifies the connection of the social sciences and humanities to the natural sciences.</p></sec><sec> <title>Conclusions</title> <p>Maps of science resulting from large-scale clickstream data provide a detailed, contemporary view of scientific activity and correct the underrepresentation of the social sciences and humanities that is commonly found in citation data.</p></sec>

## Abstract [Top](#)

### Background

The impact of scientific publications has traditionally been expressed in terms of citation counts. However, scientific activity has moved online over the past decade. To better capture scientific impact in the digital era, a variety of new impact measures has been proposed on the basis of social network analysis and usage log data. Here we investigate how these new measures relate to each other, and how accurately and completely they express scientific impact.

## PLoS and Mendeley API Contest

Posted on [June 17, 2011](#) | [Leave a comment](#)

PLoS and [Mendeley](#), the popular reference manager and academic social network, have teamed up to create a [Binary Battle contest](#) to build the best apps using PLoS and/or Mendeley's APIs. There's \$16,000 in prize money to be won and the opportunity to get your app in front of a panel of influential judges from technology, media and science.

The prizes include:

- Grand prize: \$10001 + \$1000 [Amazon Web Services](#) credits
- Second prize: \$5000 + \$500 Amazon Web Services credits

“The Dirty War Index (DWI) method has been adapted for use in NATO military environments to monitor civilian, woman and child casualties. This version of the DWI is called a ‘Civilian Battle Damage Assessment Ratio’ (CBDAR).

Since October 2009, the CBDAR methodology has been used by NATO forces in Southern Afghanistan in order to reduce the possibility of injuring Afghan civilians. The methodology has identified a number of military activities that historically lead to civilian mortality that has led to NATO changing procedures.”

## Today's Feature

### Accuracy of ARGOS Locations of Pinnipeds at-Sea Estimated Using Fastloc GPS

How accurate is ARGOS satellite tracking compared to GPS for monitoring the movements and behaviors of marine mammals, such as seals? A study in PLoS ONE has shown that ARGOS – which is much cheaper and easier than GPS – does much better tracking marine mammals that spend more time on the surface, as opposed to those frequently underwater in deep dives.

### Abstract

[Other Sections?](#)

This case study shows the application of nontraditional diagnostic methods to investigate the microbial consortia inhabiting an ancient manuscript. The manuscript was suspected to be biologically deteriorated and SEM observations showed the presence of fungal spores attached to fibers, but classic culturing methods did not succeed in isolating microbial contaminants. Therefore, molecular methods, including PCR, denaturing gradient gel electrophoresis (DGGE), and clone libraries, were used as a sensitive alternative to conventional cultivation techniques. DGGE fingerprints revealed a high biodiversity of both bacteria and fungi inhabiting the manuscript. DNA sequence analysis confirmed the existence of fungi and bacteria in manuscript samples. A number of fungal clones identified on the manuscript showed similarity to fungal species inhabiting dry or saline environments, suggesting that the manuscript environment selects for osmophilic or xerophilic fungal species. Most of the bacterial sequences retrieved

## Curator's Note

I included the Gyps paper because it concerns phylogeny, genetic diversity and species distinctiveness of three

critically endangered vulture species with important ecological roles as scavengers. They have experienced extremely rapid population declines in the past decade, and the analyses presented can help inform conservation practices. The phylogenetic analyses supports recognition of *Gyps tenuirostris* as a distinctive species, rather than a subspecies, worthy of listing for protection.

David Mindell

## Abstract

[Other Sections?](#)

## Background

Populations of the Oriental White-backed Vulture (*Gyps bengalensis*) have declined by over 95% within the past decade. This decline is largely due to incidental consumption of the non-steroidal anti-inflammatory veterinary pharmaceutical diclofenac, commonly used to treat domestic livestock. The conservation status of other *Gyps* vultures in southern Asia is also of immediate concern, given the lack of knowledge regarding status of their populations and the continuing existence of taxonomic uncertainties. In this study, we assess phylogenetic relationships for all recognized species and the majority of subspecies within the genus *Gyps*. The continuing veterinary use of diclofenac is an unknown but potential risk to related species with similar feeding habits to *Gyps*

### Description

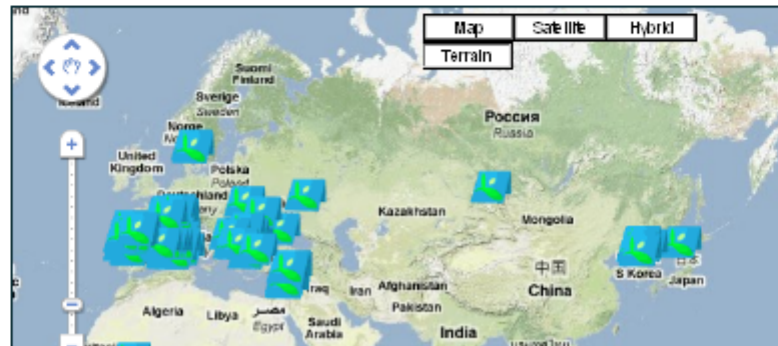

The **Chierous Vulture** (*Aegypius monachus*) is also known as the **Black Vulture**, **Monk Vulture**, or **Eurasian Black Vulture**. It is a member of the family **Accipitridae**, which also includes many other diurnal raptors such as hawks, buzzards and kites. This bird is an Old World vulture, and is only distantly related to the New World vultures, which are in a separate family, **Cathartidae**, of the order **Ciconiiformes**. It is therefore not directly related to the American Black Vulture despite the similar name and coloration. It breeds across southern Europe and Asia from Spain to Korea, but is endangered throughout its European range. It is resident except in those parts of its range where hard winters cause limited movement. The Chierous Vulture is perhaps the largest of the birds of prey in the world, though nearly equalled by the Himalayan Griffon Vulture. The Andean Condor, slightly larger, is now generally considered unrelated to the true Falconiformes. This large bird is 96–120 cm (39–47 in) long with a 270–310 cm (99–119 in) wingspan and a weight of 7–14 kg (15.5–31 lb), and is thus one of the world's heaviest flying birds. It breeds in high mountains and large forests, nesting in ...
