# The XENONnT Experiment:

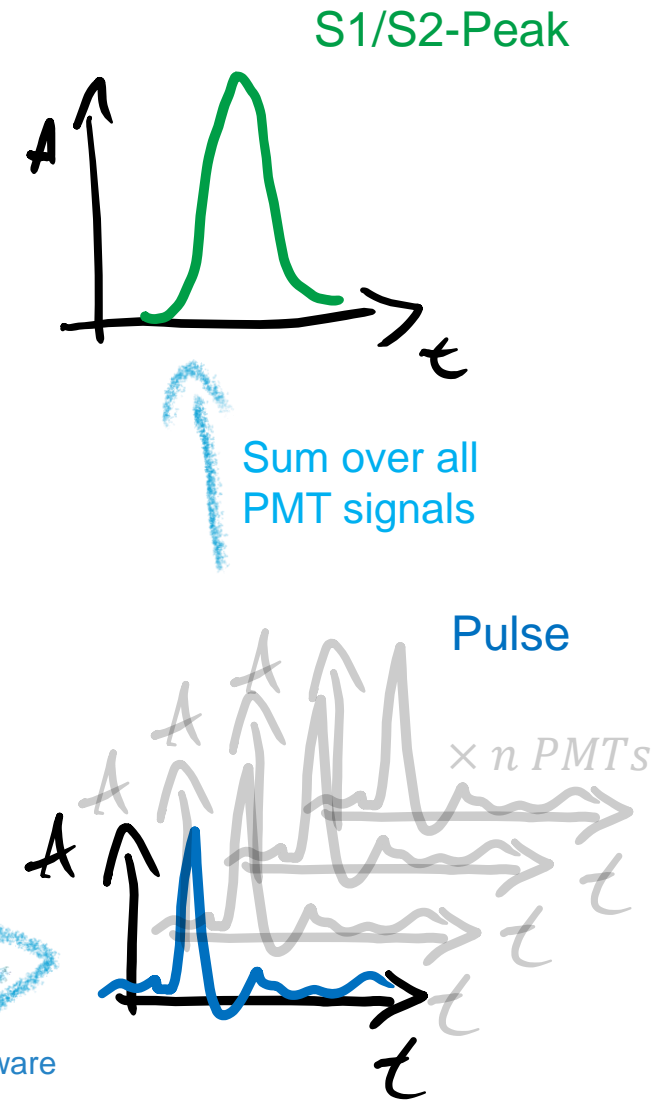

XENONnT Analysis software

# The XENONnT Experiment:

Selftriggered, 10 ns binned data  
**redax**: 50 MB/s  
 LZ: 98.3 MB/s<sup>(1)</sup> (triggered)  
 Atlas: 340 MB/s<sup>(2)</sup> (triggered)

(1) LZ technical design Report, LZ Collaboration  
[arxiv:1703.09144](https://arxiv.org/abs/1703.09144)  
 (2) [ATLAS Fact Sheet](#), Atlas Collaboration

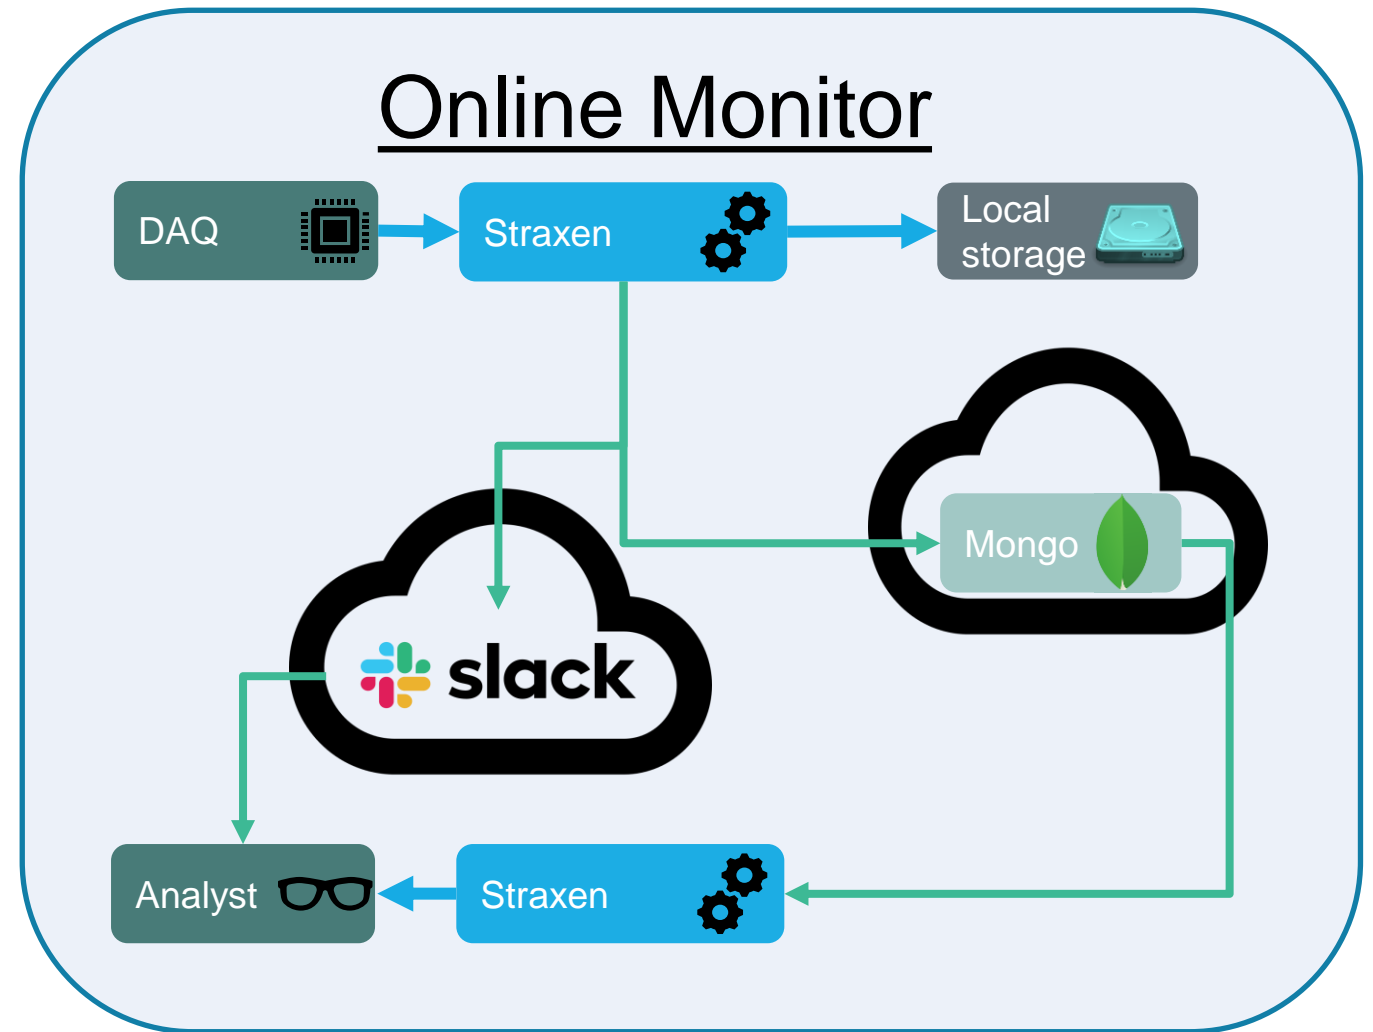

XENONnT Analysis software

Demo:

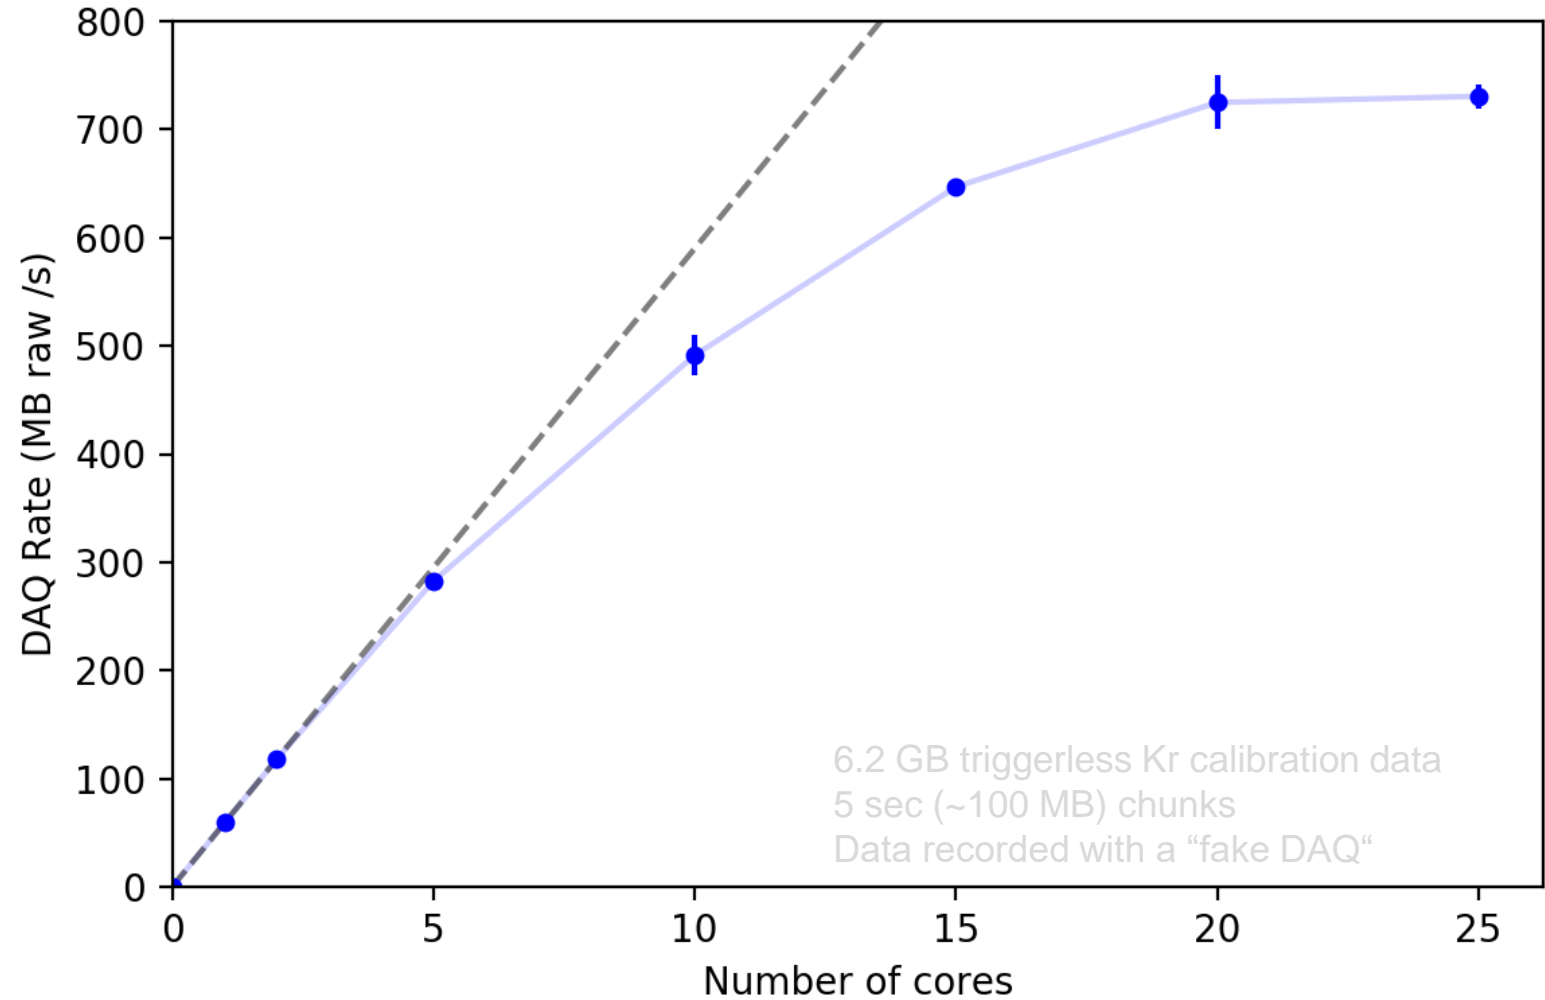

# Online processing

- Full event reconstruction at the DAQ on triggerless data
  - Baselining
  - Hit-finding
  - Peak-finding
  - Position-reconstruction (3 neural nets)
  - Corrections
  - etc
- Events available within ~30 s
- Fully integrated into slack messaging platform

## Performance:

- From XENON1T → **XENONnT**
- pax → **strax**
- 0.2 MB/s/core → **60 MB/s/core**

# How does this work?

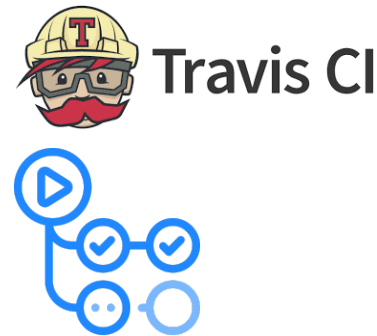

**Strax:**

Streaming analysis for xenon

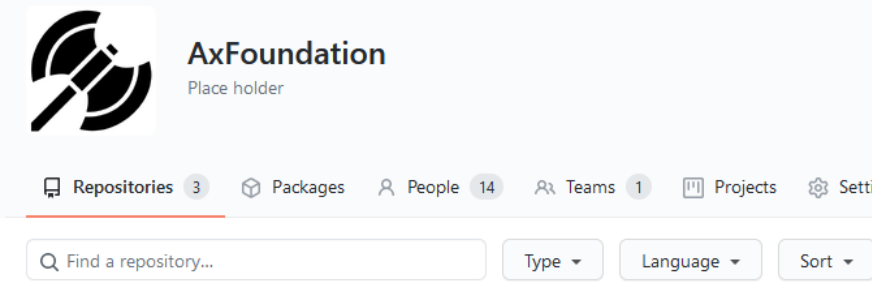

# Software:

- Split between:
  - general & optimized code (strax)
  - detector specific software (straxen)
- Continuous integration for testing:
  - [Travis-ci](#)
  - [Github actions](#)
  - Many more
- The core code is public
- Analyses & detector conditions private

Travis CI

XENONnT Analysis software

# Pulse-Peaks-Events in no time:

Pulse

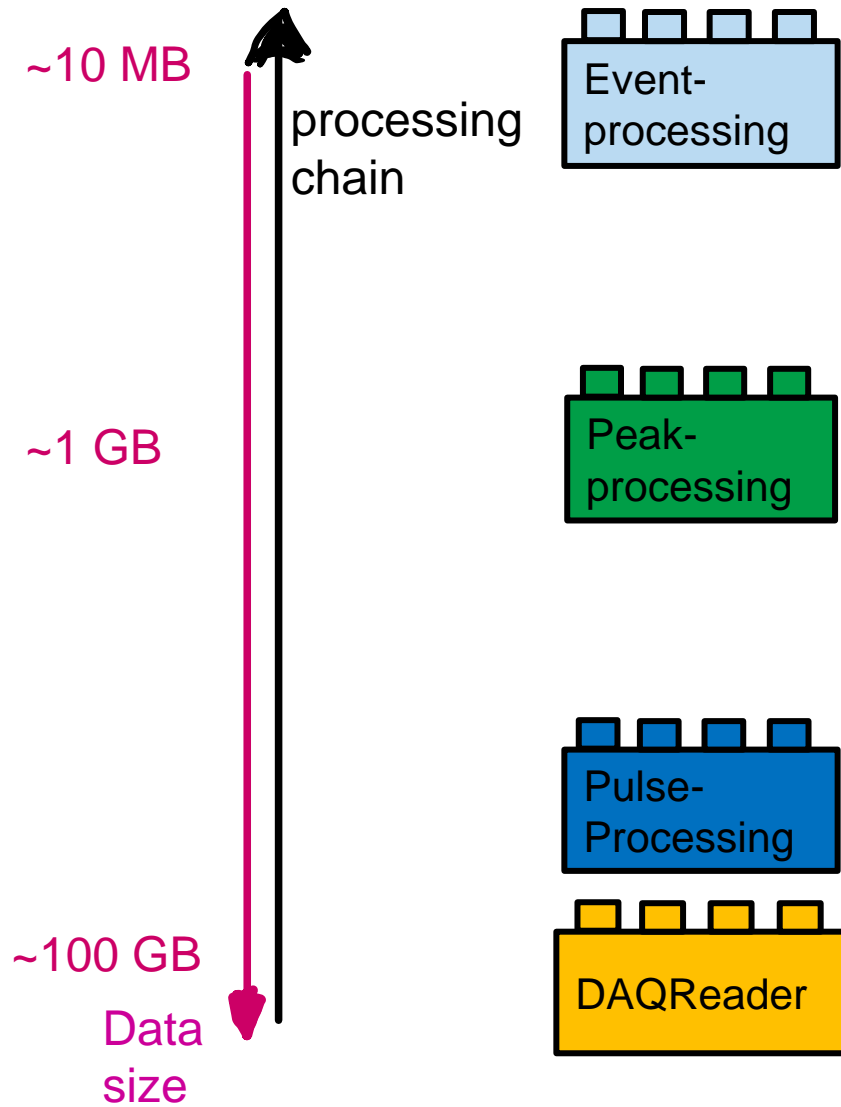

Peak

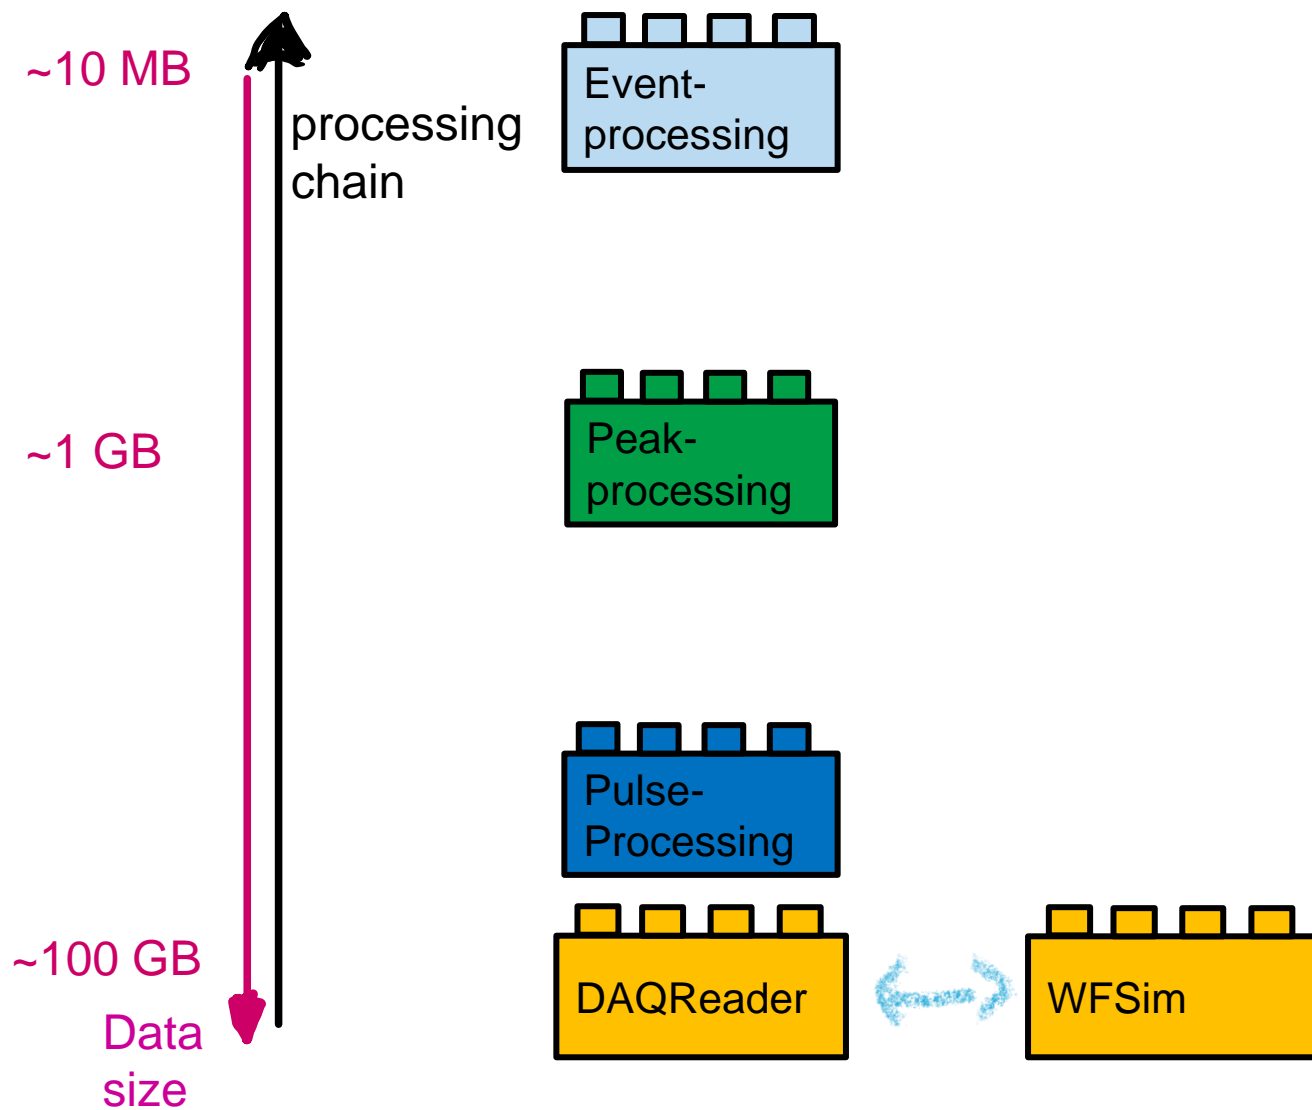

Event

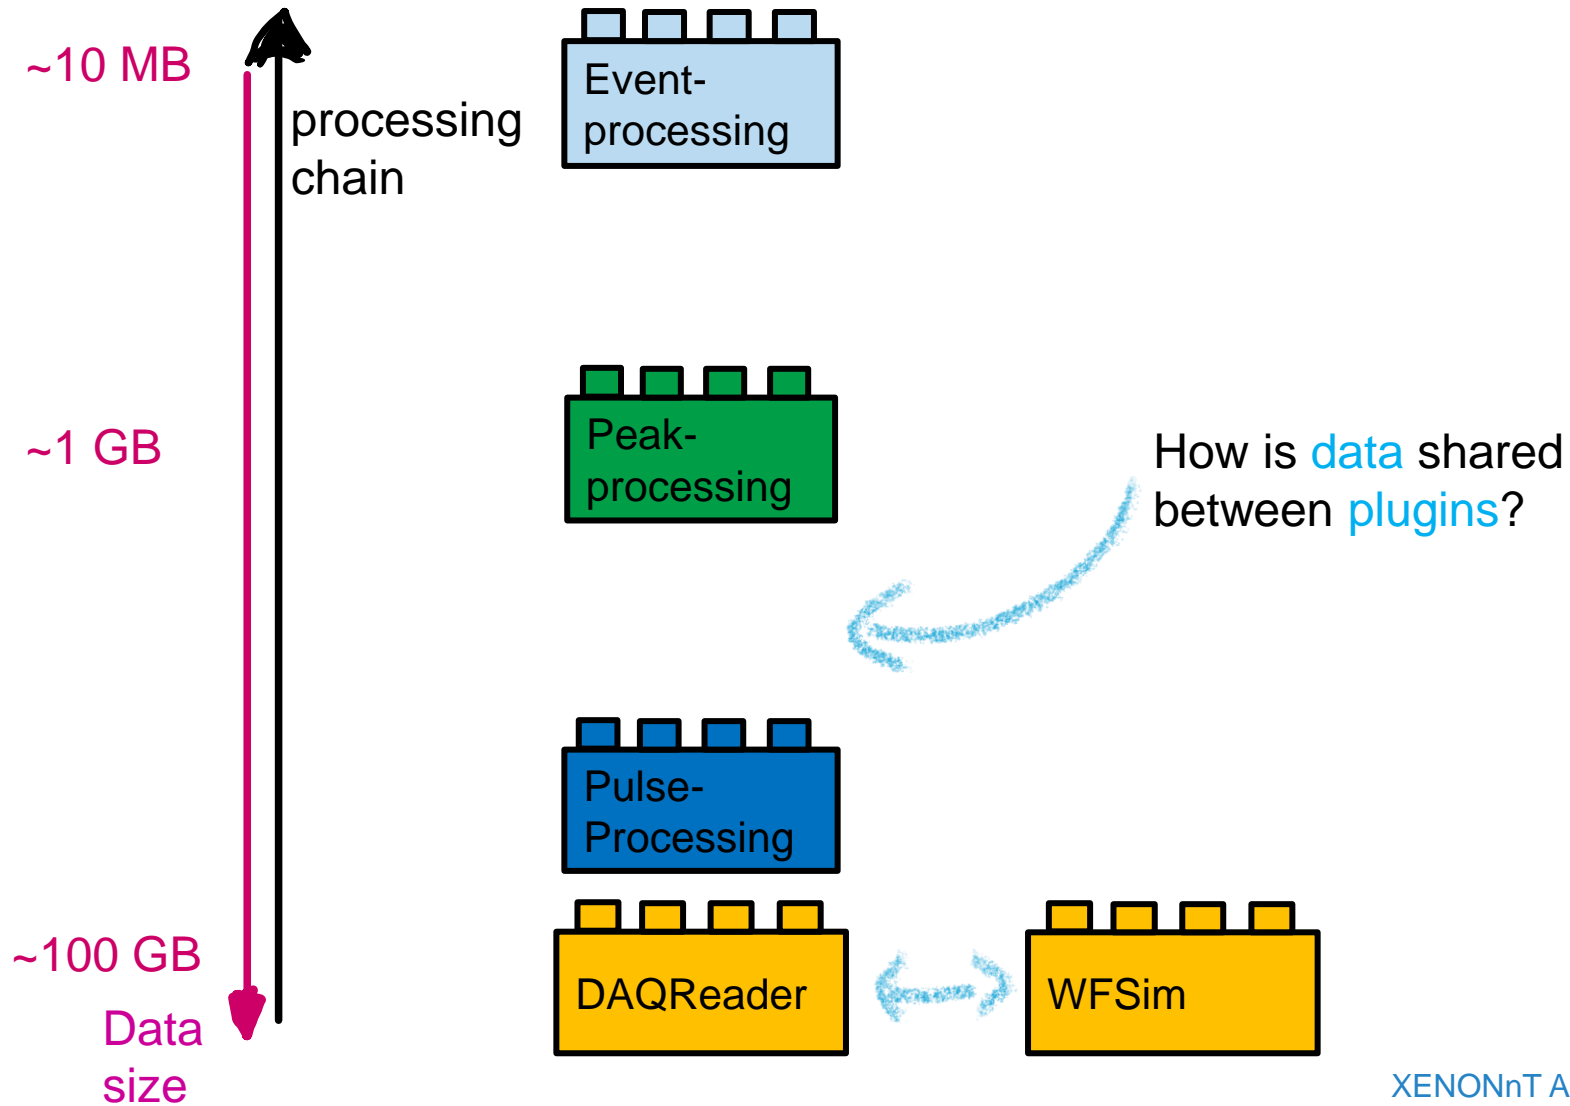

# Strax Plugins:

# Strax Plugins:

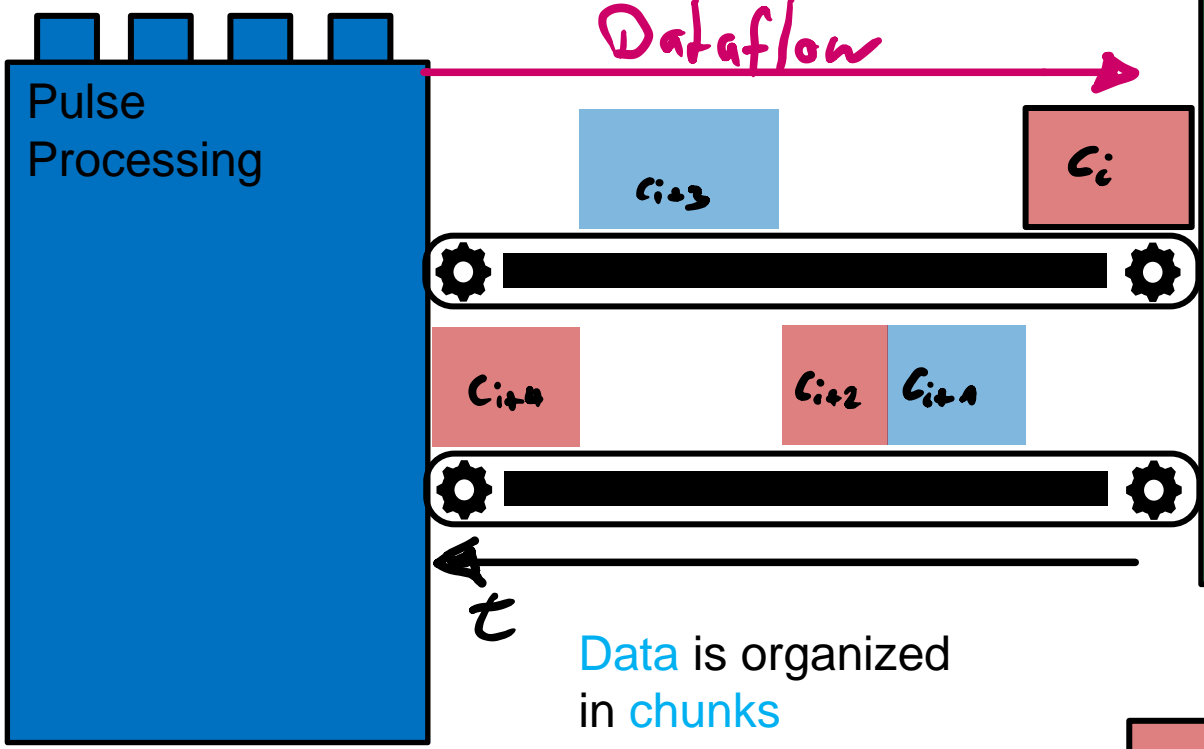

# Strax Plugins:

# Strax dataformat

Data is organized in chunks

```
import numpy
import numba
import scipy
```

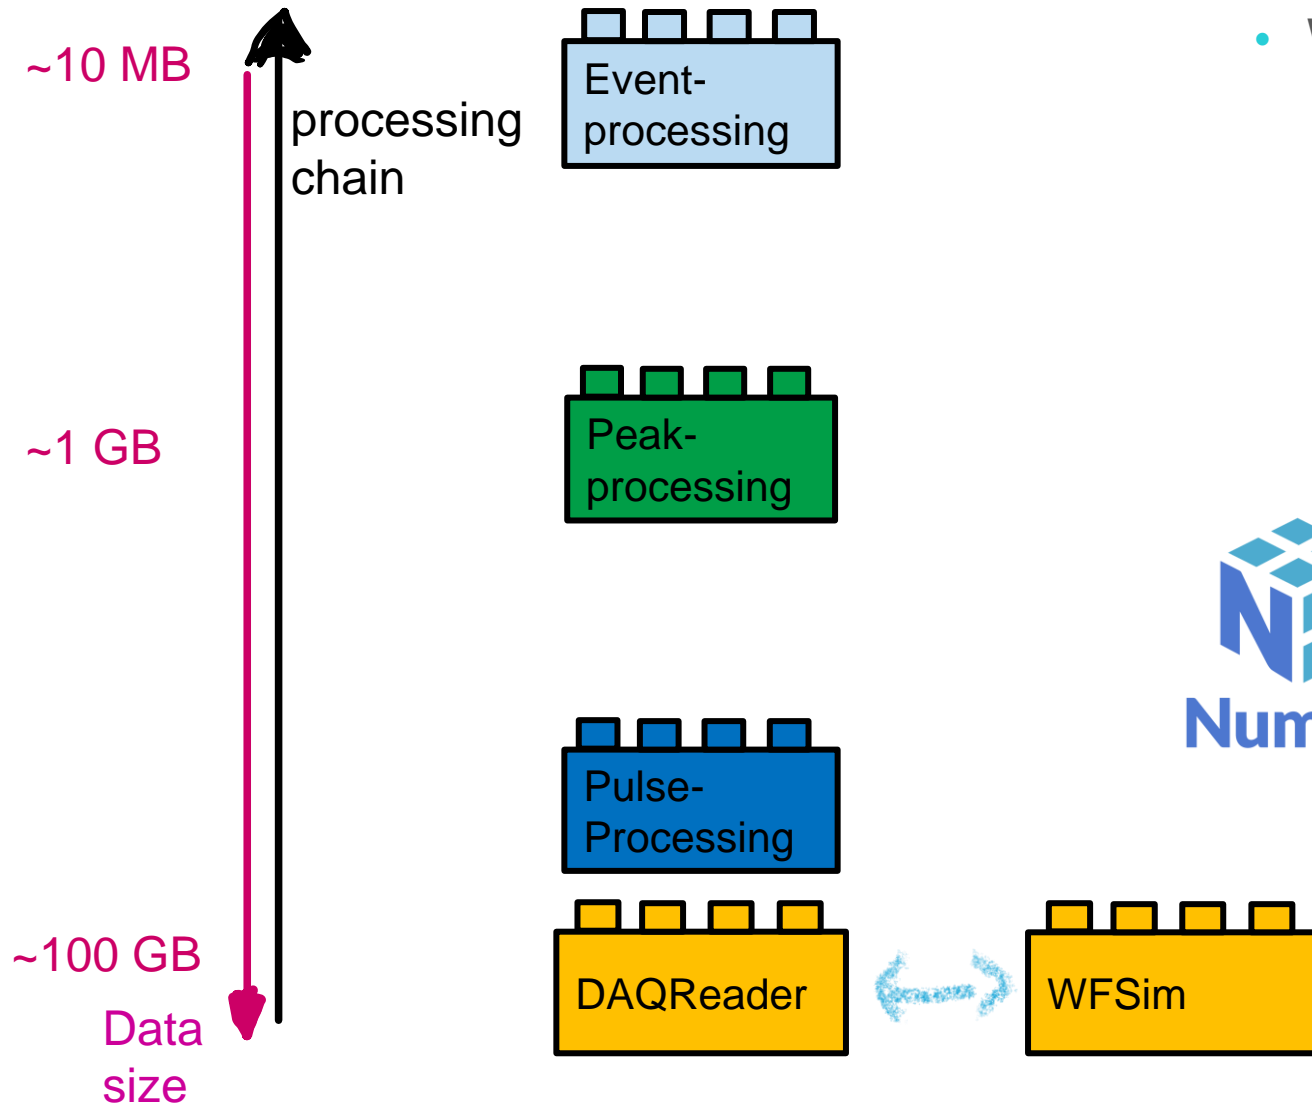

Data within a chunk in tabular format.

time and length, dtype + numpy structured arrays

Time	Channel	Index	Data
15432	24	0	
15452	89	0	
15555	393	0	
15665	393	1	
15775	393	2	

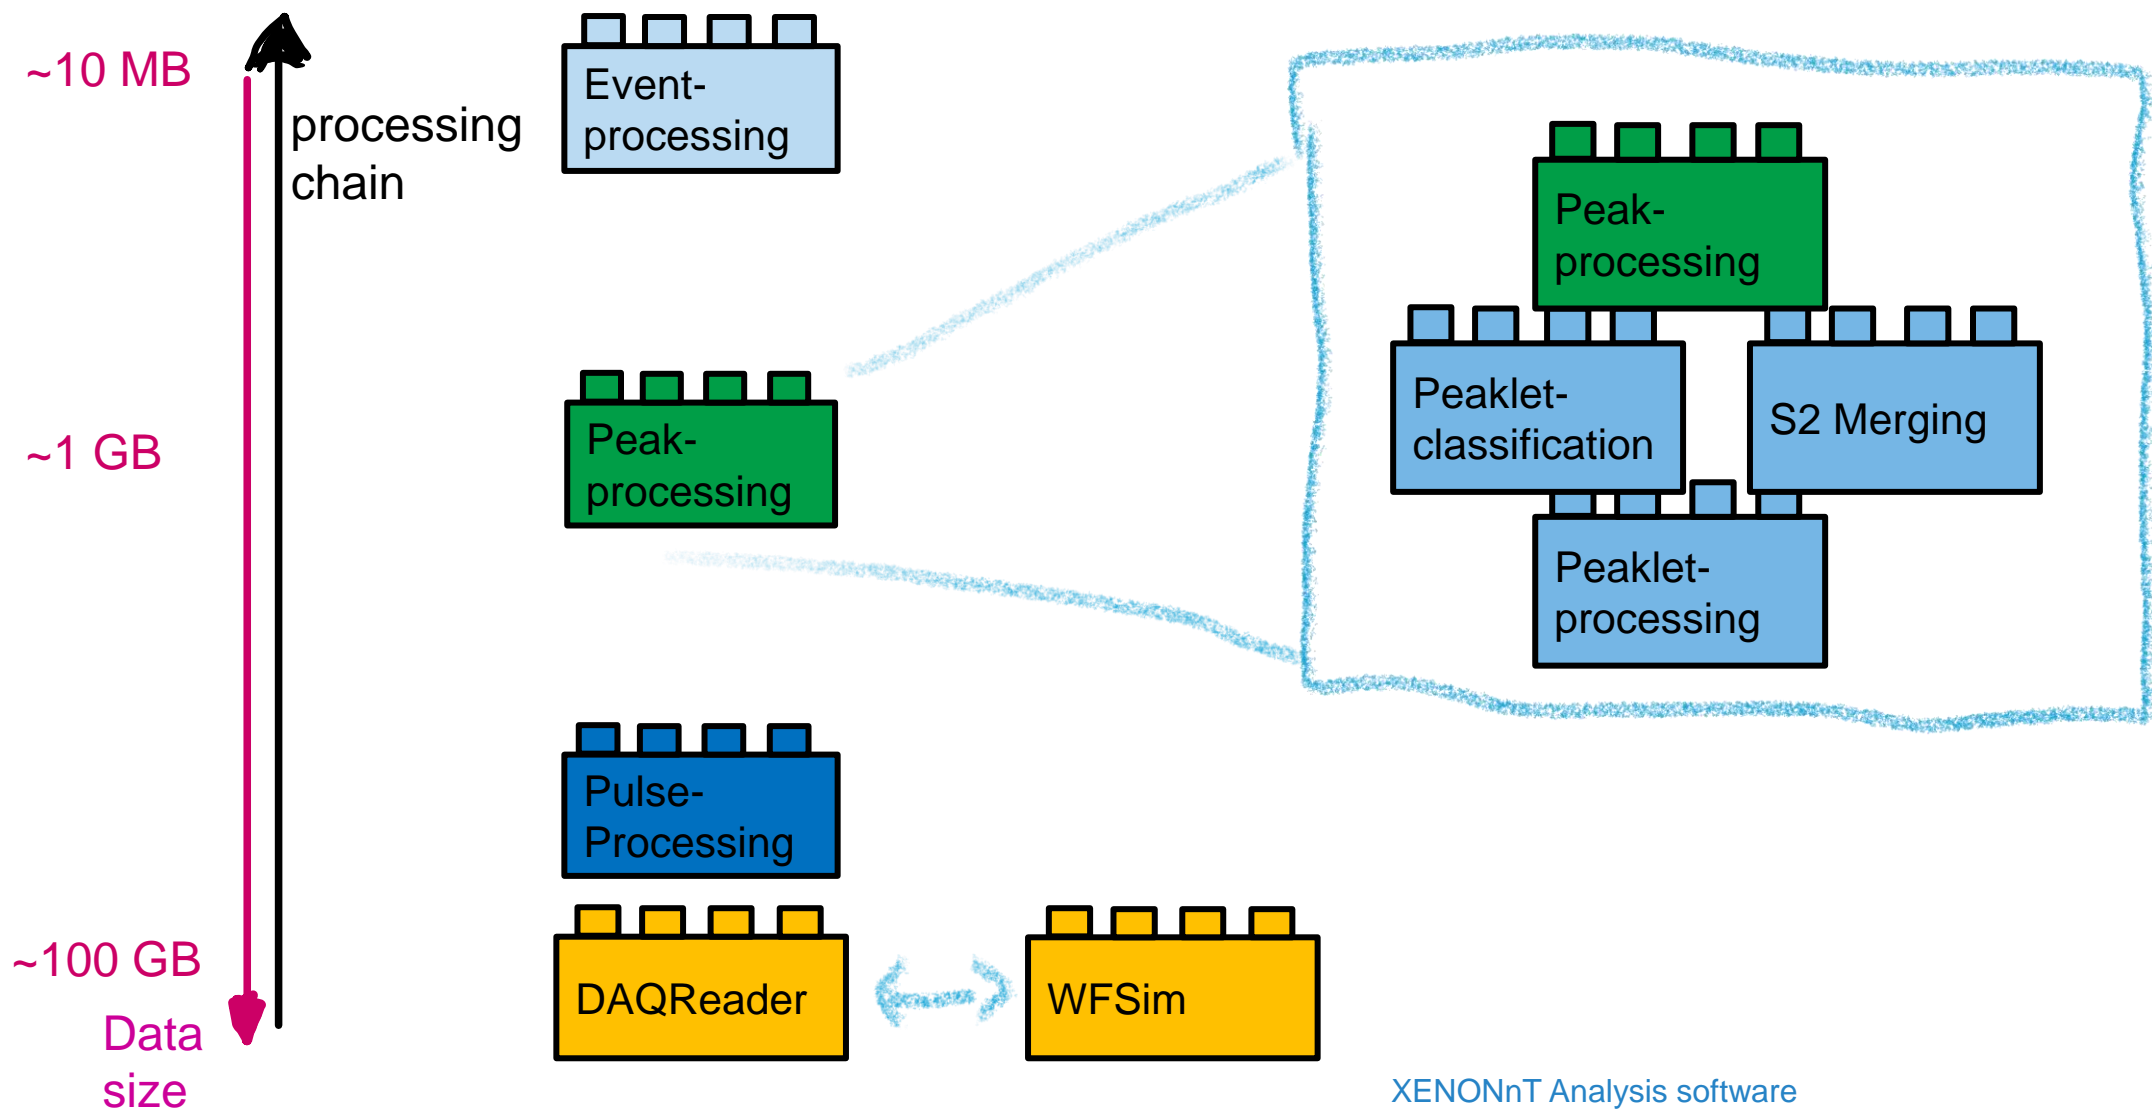

# Strax Plugins:

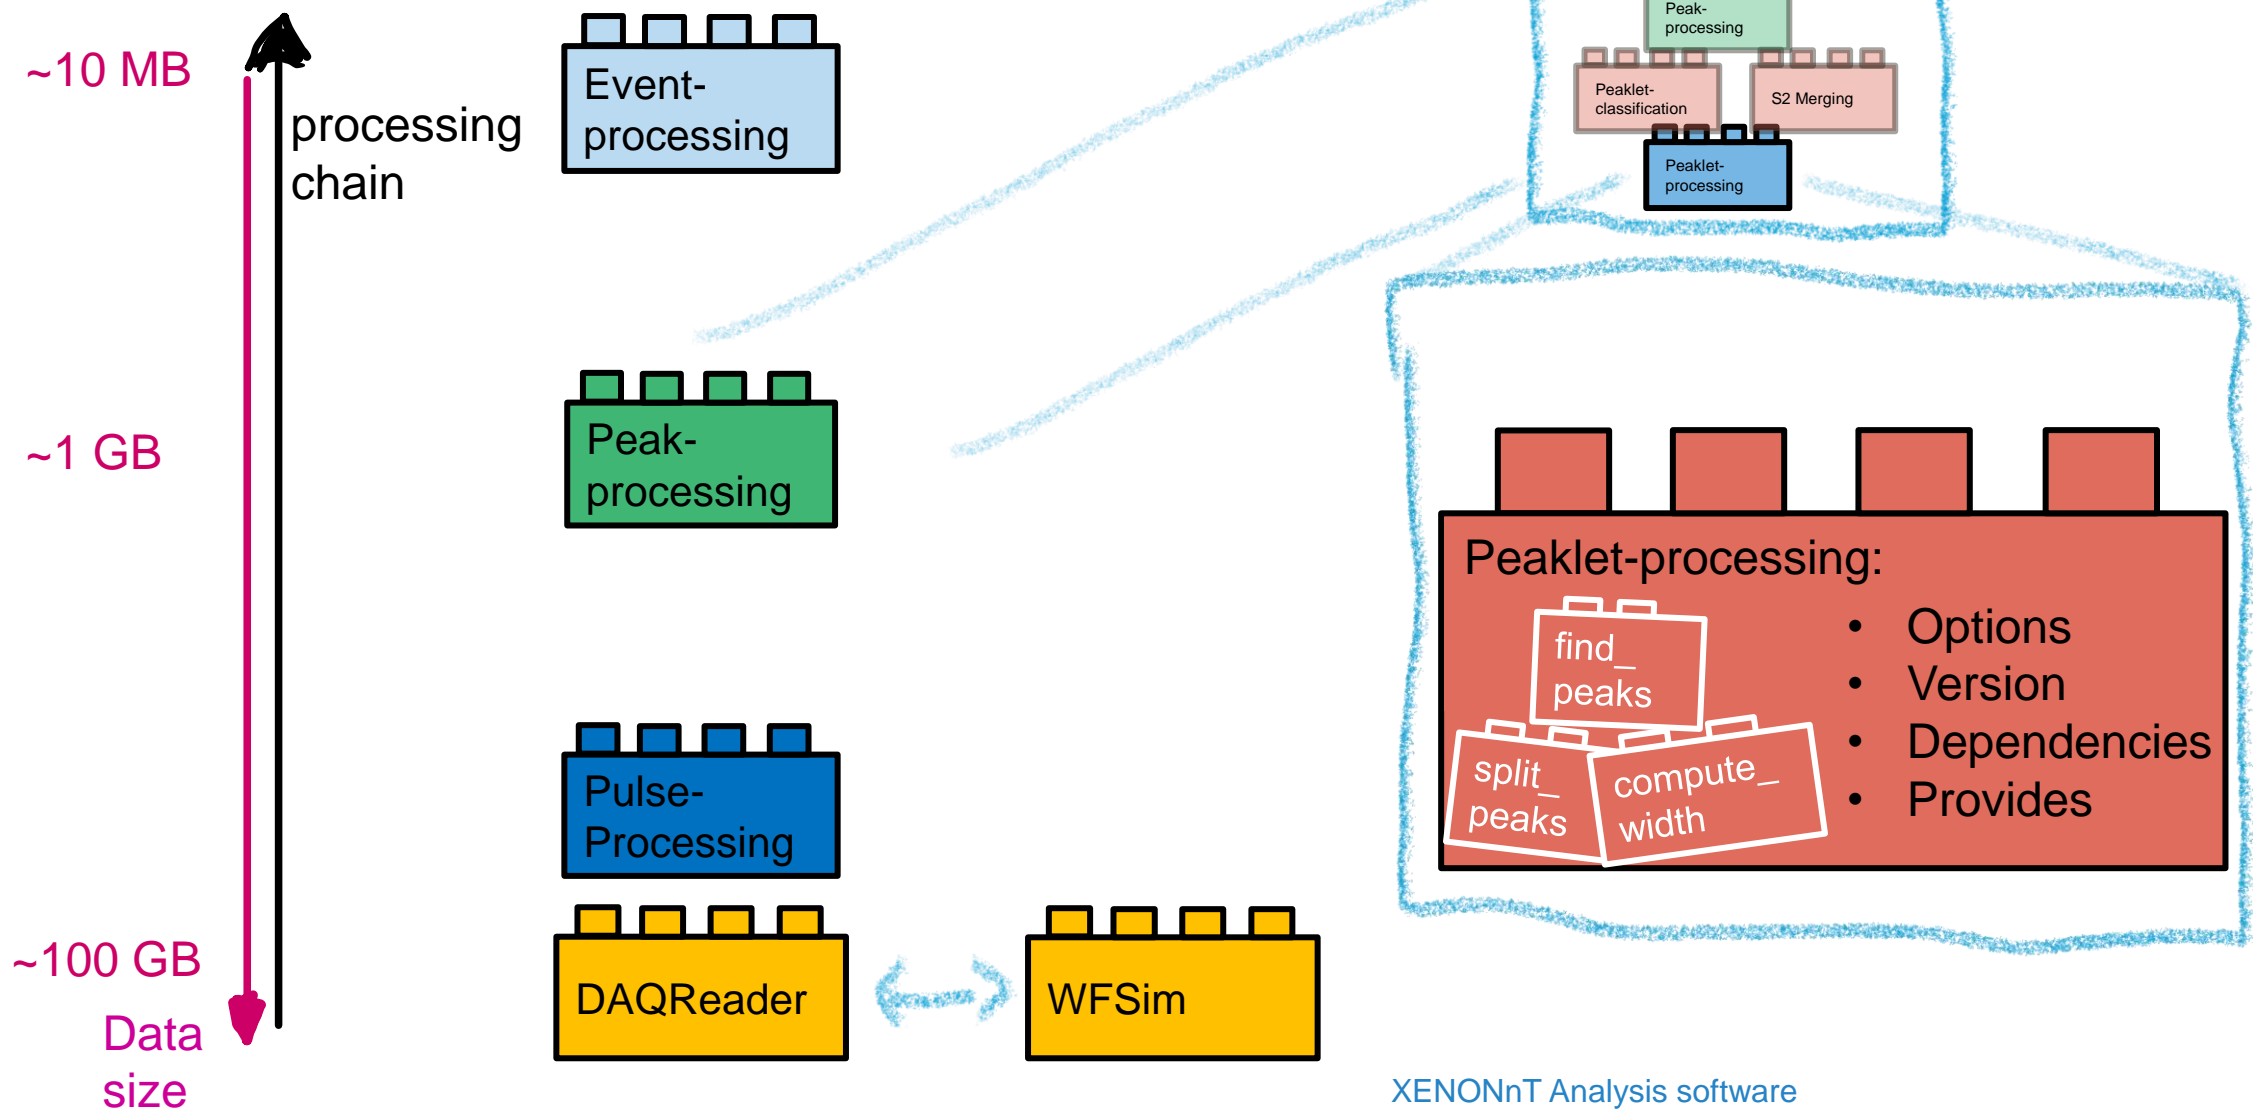

- We chose Python
  - `numba` & `numpy` make it fast
    - just-in-time compilation
  - cast data in tabular shape
    - tabular data allows autovectorization
