

$H \rightarrow \gamma \gamma @ 3 TeV$

Discussion on the paper to be submitted CLICdp-Draft-2021-003

CLICdp AWG, 17 May 2021

Goran Kacarevic, Ivanka Bozovic Jelisavcic et al. VINCA Belgrade & Uni. Kragujevac

Status and Open issues

- PhD analyses started 2015
- Results presented:
 - CLICdp AWG: 21 Feb 2017, 22 Aug 2017, 24 Feb 2020, 27 Jan 2020
 - CLIC WS 2017, 2021
 - ALPS 2019
 - LCWS21
- Paper submitted to the Pub. Com. 25th of January 2021
- Draft number CLICdp-Draft-2021-003 assigned
- Resolved issue of systematic uncertainty estimate from the reconstruction of the luminosity spectrum

(P. Roloff commented that our estimate based of fraction of selected signal events at various center-of-mass energies is too conservative – leads to overestimate)

Are we double-counting background by including mono-photon processes (ee γ , $\nu\nu\gamma$, qq γ)?

- A bit of a history...
 - These processes were considered in the same analysis at 1.4 TeV (published in the Higgs paper)
 - WHIZARD V1.95 used in both analyses
 - ...under similar user's requirements

1.4 TeV

samples

Cuts on generated final states*:

- At least two photons with $E > 10\,{
 m GeV},\, p_{
 m T} > 5\,{
 m GeV}$ and $5^\circ < heta < 175^\circ$
- At least one Higgs candidate with $110\,{\rm GeV} < M(\gamma\gamma) < 140\,{\rm GeV}$
- No visible lepton or quark with $10^\circ < \theta < 170^\circ$

*Second photon comes from ISR or FSR (background)

Cuts on generated final states*:

- 1. di-photon invariant mass in the window (100-150) GeV
- 2. at least two photons in event with polar angle between 5 deg and 175 deg
- 3. $p_T > 10$ GeV of the photons
- 4. We haven't restricted q or l in the tracker can be refined

Discussion

Are we double-counting background by including mono-photon processes (ee γ , $\nu\nu\gamma$, qq γ)?

- There are several questions that can be asked:
- 1) Are cross-sections for processes with a single photon in the final state correctly reproduced in WHIZARD V1.95?

 N_{BDT} , for integrated luminosity of 5 ab⁻¹

2) Is kinematics of the final state photon properly described?

	1 (BD1,		
Process	$\epsilon_{pre}(\%)$	$\mathcal{E}_{BDT}(\%)$	N _{BDT}
$e^+e^- \rightarrow H \nu \nu, H \rightarrow \gamma \gamma$	70	62.0	2062
$e^+e^- o \gamma\gamma^*$	0.10	13.7	624
$e^+e^- ightarrow e^+e^-\gamma st$	0.03	9.8	26598
$e^+e^- ightarrow e^+e^-\gamma\gammast$	0.05	7.4	788
$e^+e^- ightarrow u u \gamma^*$	0.09	25.0	18585
$e^+e^- ightarrow u u \gamma \gamma st$	0.04	24.5	11628
$e^+e^- ightarrow qq\gamma$	0.50	7.5	1089
$e^+e^- ightarrow qq\gamma\gamma$	1	10.1	423
	Process $e^+e^- \rightarrow H\nu\nu, H \rightarrow \gamma\gamma$ $e^+e^- \rightarrow e^+e^-\gamma^*$ $e^+e^- \rightarrow e^+e^-\gamma\gamma^*$ $e^+e^- \rightarrow \nu\nu\gamma^*$ $e^+e^- \rightarrow \nu\nu\gamma\gamma^*$ $e^+e^- \rightarrow qq\gamma$ $e^+e^- \rightarrow qq\gamma\gamma$	Process $\varepsilon_{pre}(\%)$ $e^+e^- \rightarrow H\nu\nu, H \rightarrow \gamma\gamma$ 70 $e^+e^- \rightarrow \gamma\gamma^*$ 0.10 $e^+e^- \rightarrow e^+e^-\gamma^*$ 0.03 $e^+e^- \rightarrow e^+e^-\gamma\gamma^*$ 0.05 $e^+e^- \rightarrow e^+e^-\gamma\gamma^*$ 0.09 $e^+e^- \rightarrow \nu\nu\gamma\gamma^*$ 0.04 $e^+e^- \rightarrow qq\gamma$ 0.50 $e^+e^- \rightarrow qq\gamma\gamma$ 1	Process $\varepsilon_{pre}(\%)$ $\varepsilon_{BDT}(\%)$ $e^+e^- \rightarrow H\nu\nu, H \rightarrow \gamma\gamma$ 7062.0 $e^+e^- \rightarrow \gamma\gamma^*$ 0.1013.7 $e^+e^- \rightarrow e^+e^-\gamma^*$ 0.039.8 $e^+e^- \rightarrow e^+e^-\gamma\gamma^*$ 0.057.4 $e^+e^- \rightarrow v\nu\gamma^*$ 0.0925.0 $e^+e^- \rightarrow vv\gamma^*$ 0.0424.5 $e^+e^- \rightarrow qq\gamma$ 0.507.5 $e^+e^- \rightarrow qq\gamma\gamma$ 110.1

If not, than it depends what is wrong:

NO

- a) Only cross-section \rightarrow can be cured with scaling (in MVA)
- b) Kinematics → processes in question should be reprocessed in WHIZARD (2 ?)

Without clear answers to these questions can we be convinced that it is justified to neglect mono-photon processes?

Whizard 2.8.3: $ee \rightarrow \mu\mu$

- There are no BS photons when BS is included in production
- Beamstrahlung photons are not visible in MCParticleSKimmed collection, and we cannot know if the reconstructed photon is BS photon. But we cab check it is ISR photon

Background samples

Process	N _{preselection}	N _{ISR}	event loss(%)

			\smile

If at least one candidate photon comes from ISR (RecoMCTruthLink) all backgrounds have significant loss.

Di-photon mass distribution after MVA

OLD - all background

no mono-photon

All backgrounds rescaled

	N _s	N _b	Significance/δ(%)
All backgrounds	2060	63000	8.3/12
No mono photon	2360	17000	17/5.9
All backgrounds rescaled	1926	27000	11.32/8.9

Signal Fit

OLD

no mono-photon

No relevant changes in mean and width

All backgrounds rescaled

Pull Distribution

The width of the pull distribution is reduced, resulting in a drop of statistical uncertainty from 8.3%, 4.3% and 6%.

Summary

• After 5000 Toy-MC experiments uncertainty is 8.3%, 6 % and 4.3 % when including all backgrounds, rescaling all backgrounds, removing mono-photon backgrounds respectively.
