Strange hadron production in Au+Au collisions at RHIC Beam Energy Scan

Tuesday 14 June 2022 14:00 (20 minutes)

Strangeness production has been suggested as a sensitive probe to the early-time dynamics of the nuclear matter created in heavy-ion collisions. Transverse momentum distributions and yields of strange hadrons provide important information about the particle production mechanisms and help us to understand the properties of the created medium and its evolution in these collisions.

Thanks to the high statistical data taken from the STAR BES II program in 2018-2021, a series of measurements on production yields and properties of strangeness at low energies are carried out. In this talk, the productions of K_S^0 , ϕ , Λ , Ξ^- , and Ω^- from Au+Au collisions at $\sqrt{s_{NN}} = 3, 14.5, 19.6$, and 27 GeV will be presented. The strange hadron spectra, rapidity density distributions, particle ratios, and nuclear modification factors will be reported. These results will be compared with those from higher collision energies and discussed within the framework of model calculations.
