

What are the consequences of delaying the shutdown from 2012 to 2013 for Radiation Protection?

Monday 24 January 2011 17:25 (10 minutes)

The residual induced radio-activity in the LHC underground areas in 2012 will be estimated (assuming 200 days of high intensity proton operation in 2011). These estimates will be compared with the levels that would be expected in 2013 (assuming 200 days of high intensity proton operation in both 2011 and 2012). With these estimations some consequences of delaying the shutdown from 2012 to 2013 will be presented.

Presenter: ROESLER, Stefan (CERN)

Session Classification: Session 02 Shutdown 2012 (Part 1)
