

Recent developments in AI/ML for heavy-ion experiments

Hannah Bossi (Yale University)

Initial Stages 2023

Copenhagen, Denmark

June 20th, 2023

Supported in part by

Outline

What is AI/ML and why is it useful for heavy-ion physics?

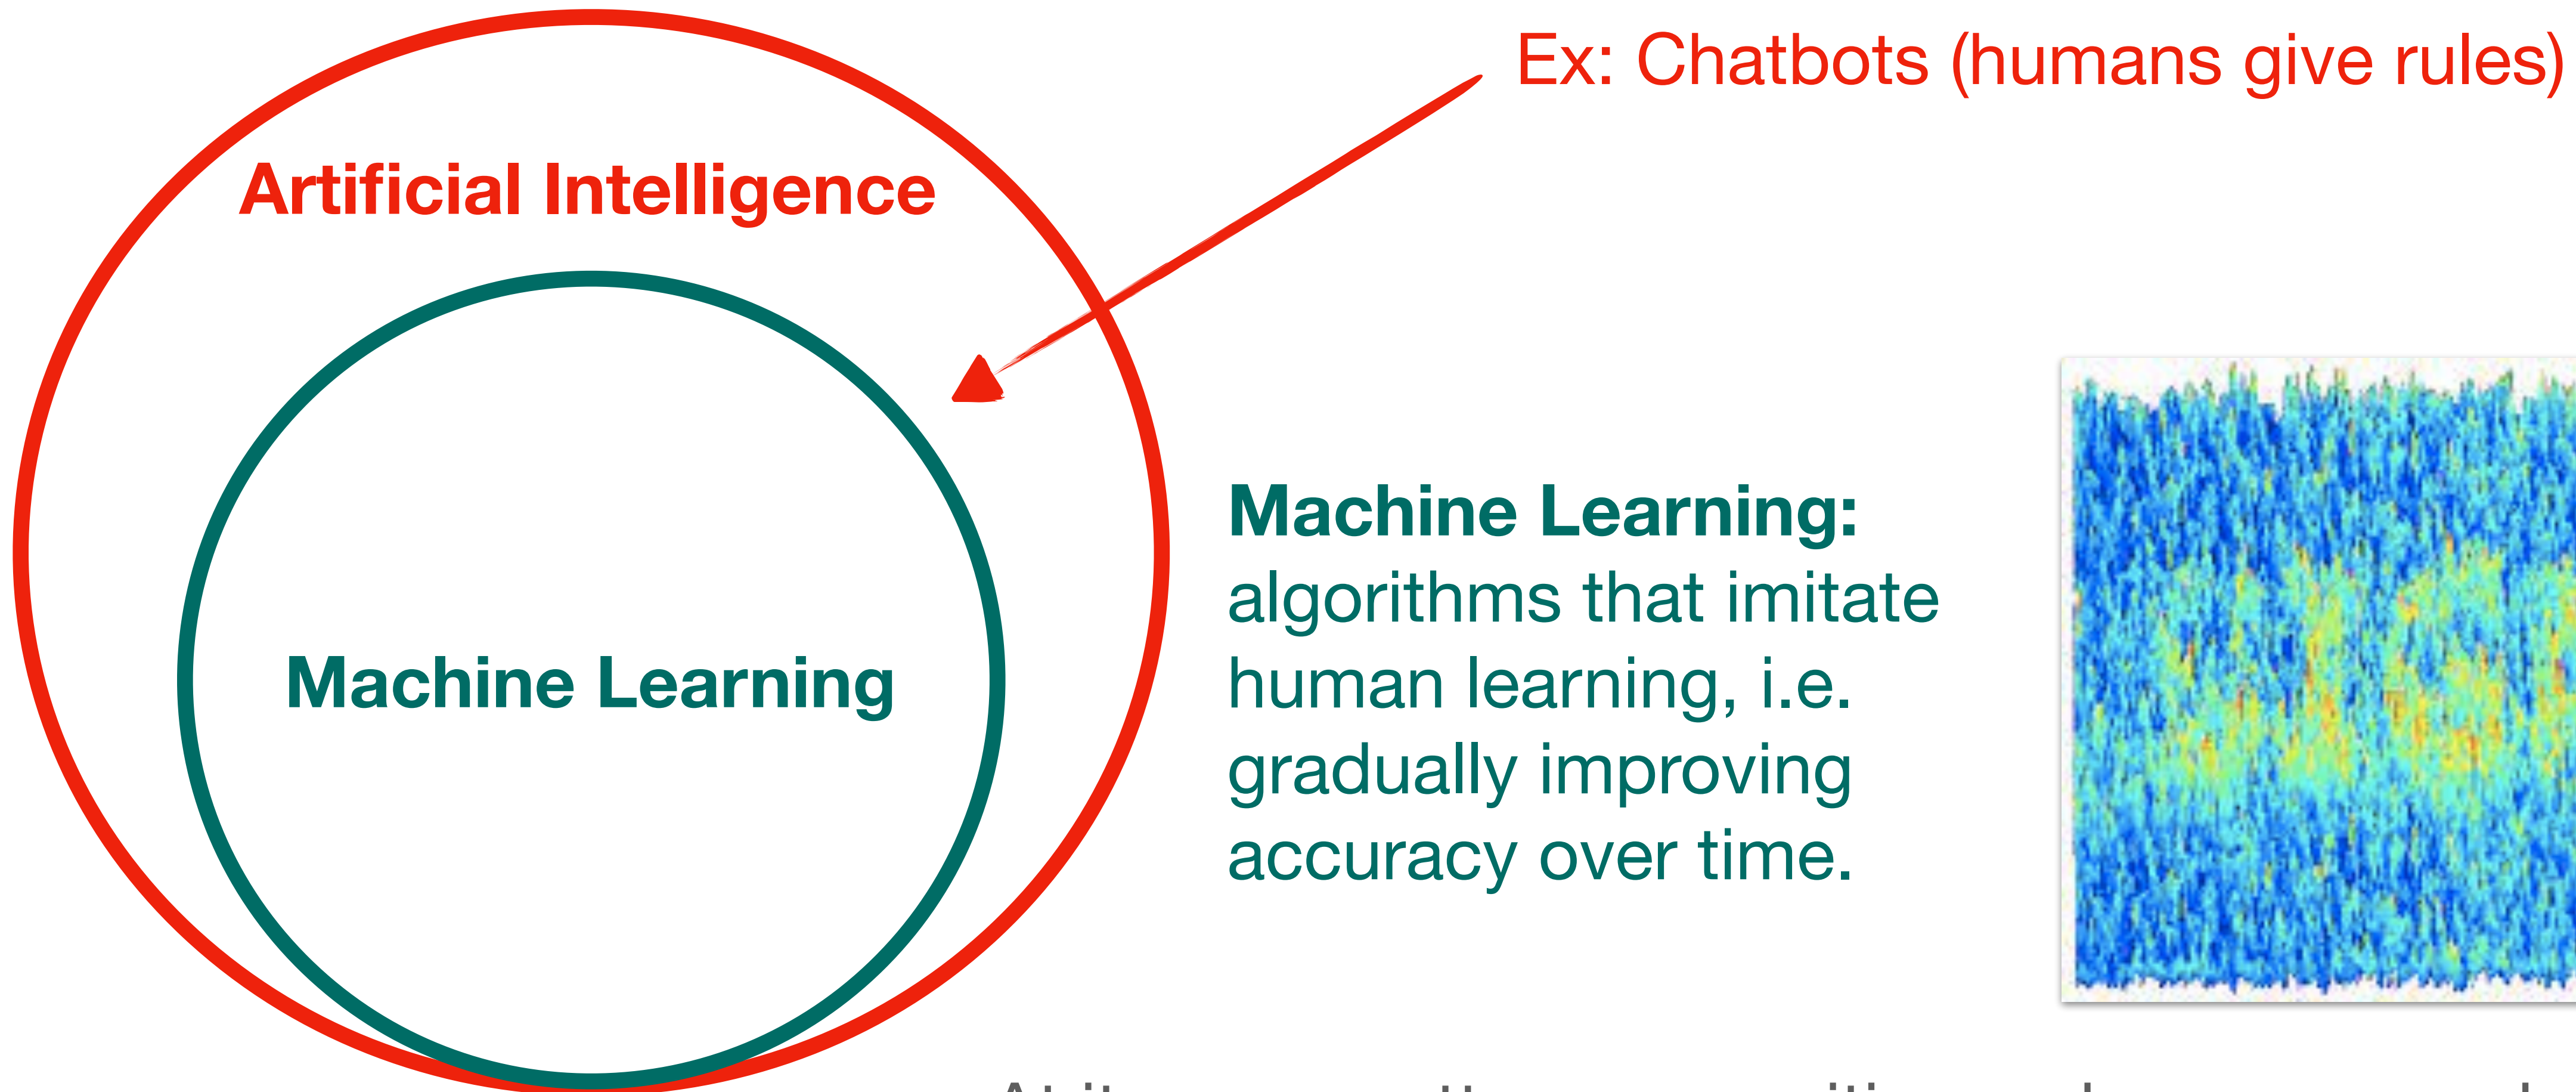

How is AI/ML currently being used by HI experiments?

How will AI/ML be used in the future?

What is machine learning?

Artificial Intelligence: Programs with the ability to acquire and apply knowledge and skills.

At its core, pattern recognition → humans can do this by eye!

What can ML *not* do?

Garbage In

Garbage Out

ML cannot replace domain knowledge.

ML is not a causation tool.

Don't want to be finding cloudy days when you should be finding tanks!

ML is not a magic fix!

Why ML and HEP?

Goal of HEP measurements: To extract relevant physics information from available data!

Conventional approach: (1) make selection using a series of boolean decisions motivated by physics/experimental constraints (2) perform a statistical analysis on selected data.

Optimal decision difficult to derive from expert knowledge alone! Employ algorithms that utilize multiple variables simultaneously → inspired countless ML applications! (Living Review)

ML and HEP

- ◆ LHC represents a medium-sized application of ML.

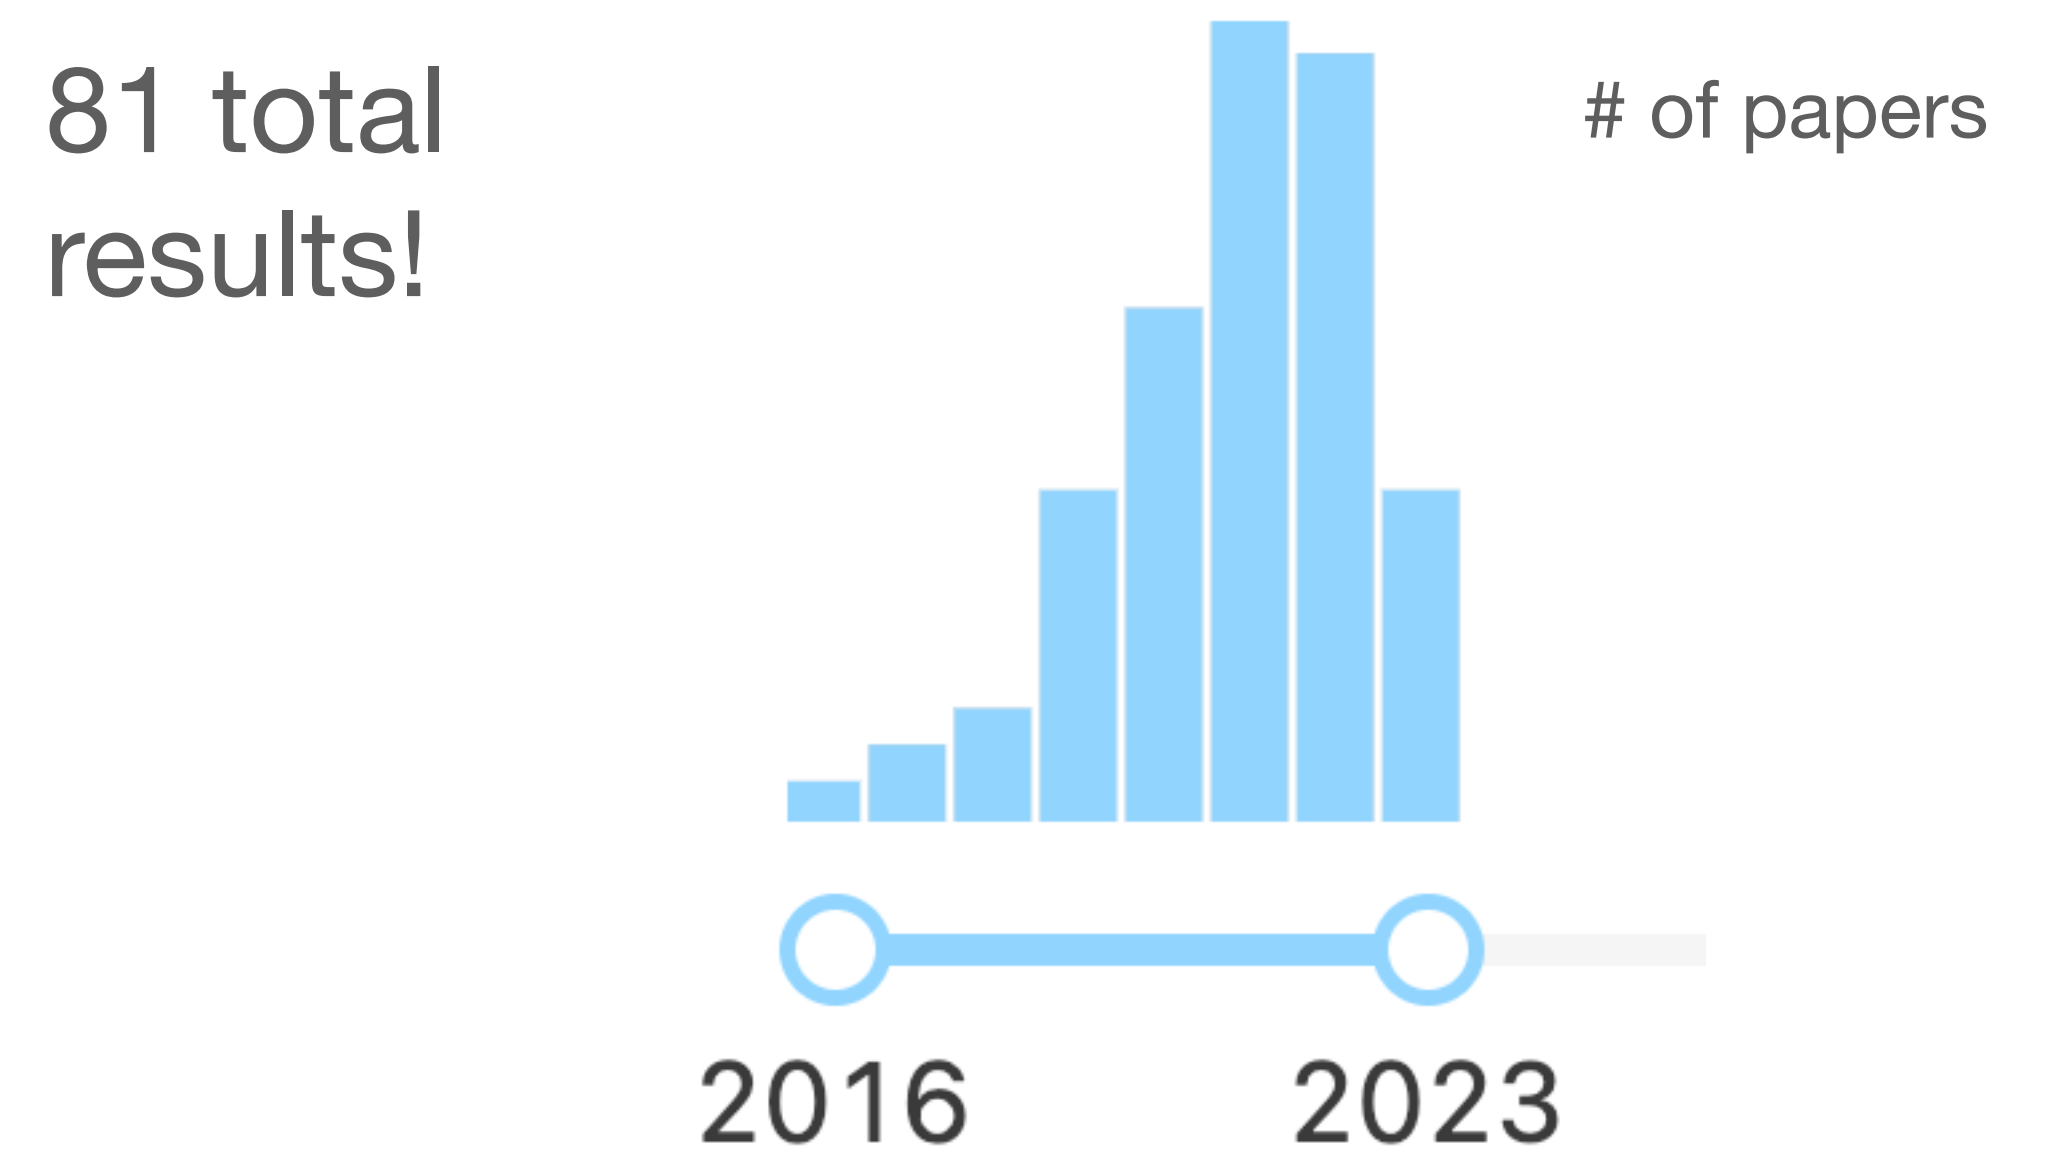

ML and heavy-ion physics

Inspire HEP search results for
“machine learning HEP”

vs.

Inspire HEP search results for
“machine learning heavy-ion physics”

ML is a rapidly growing field in HEP and HIs!

ML and heavy-ion physics

HI environment can be challenging for ML.

- ◆ Higher particle multiplicities, much more complex system (even by eye)!
- ◆ Training difficult due to large sensitivity on simulation used.

Outline

What is AI/ML and why is it useful for heavy-ion physics?

How is AI/ML currently being used by HI experiments?

How will AI/ML be used in the future?

Legend

There will be a lot of ML algorithms, physics applications, and software packages referenced!

Status

Jargon

System Size

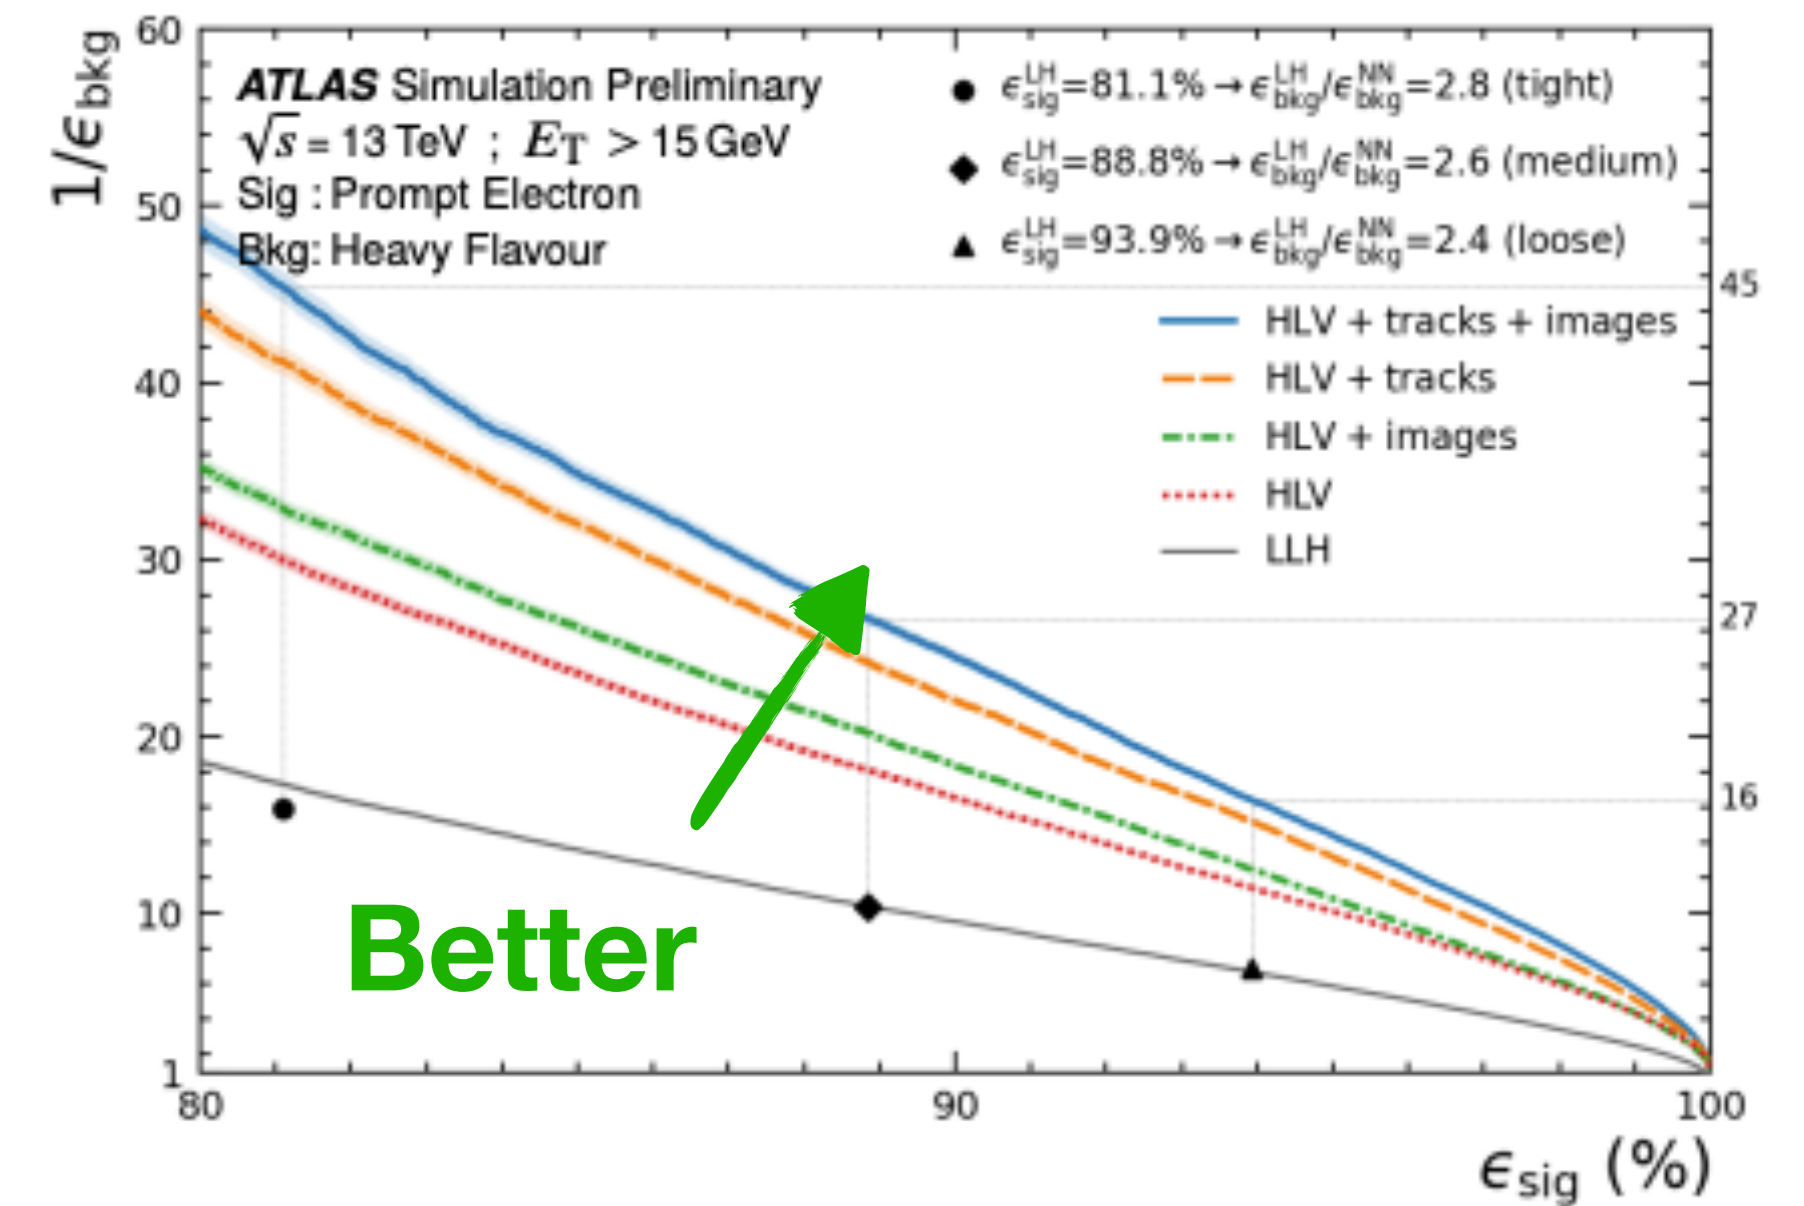

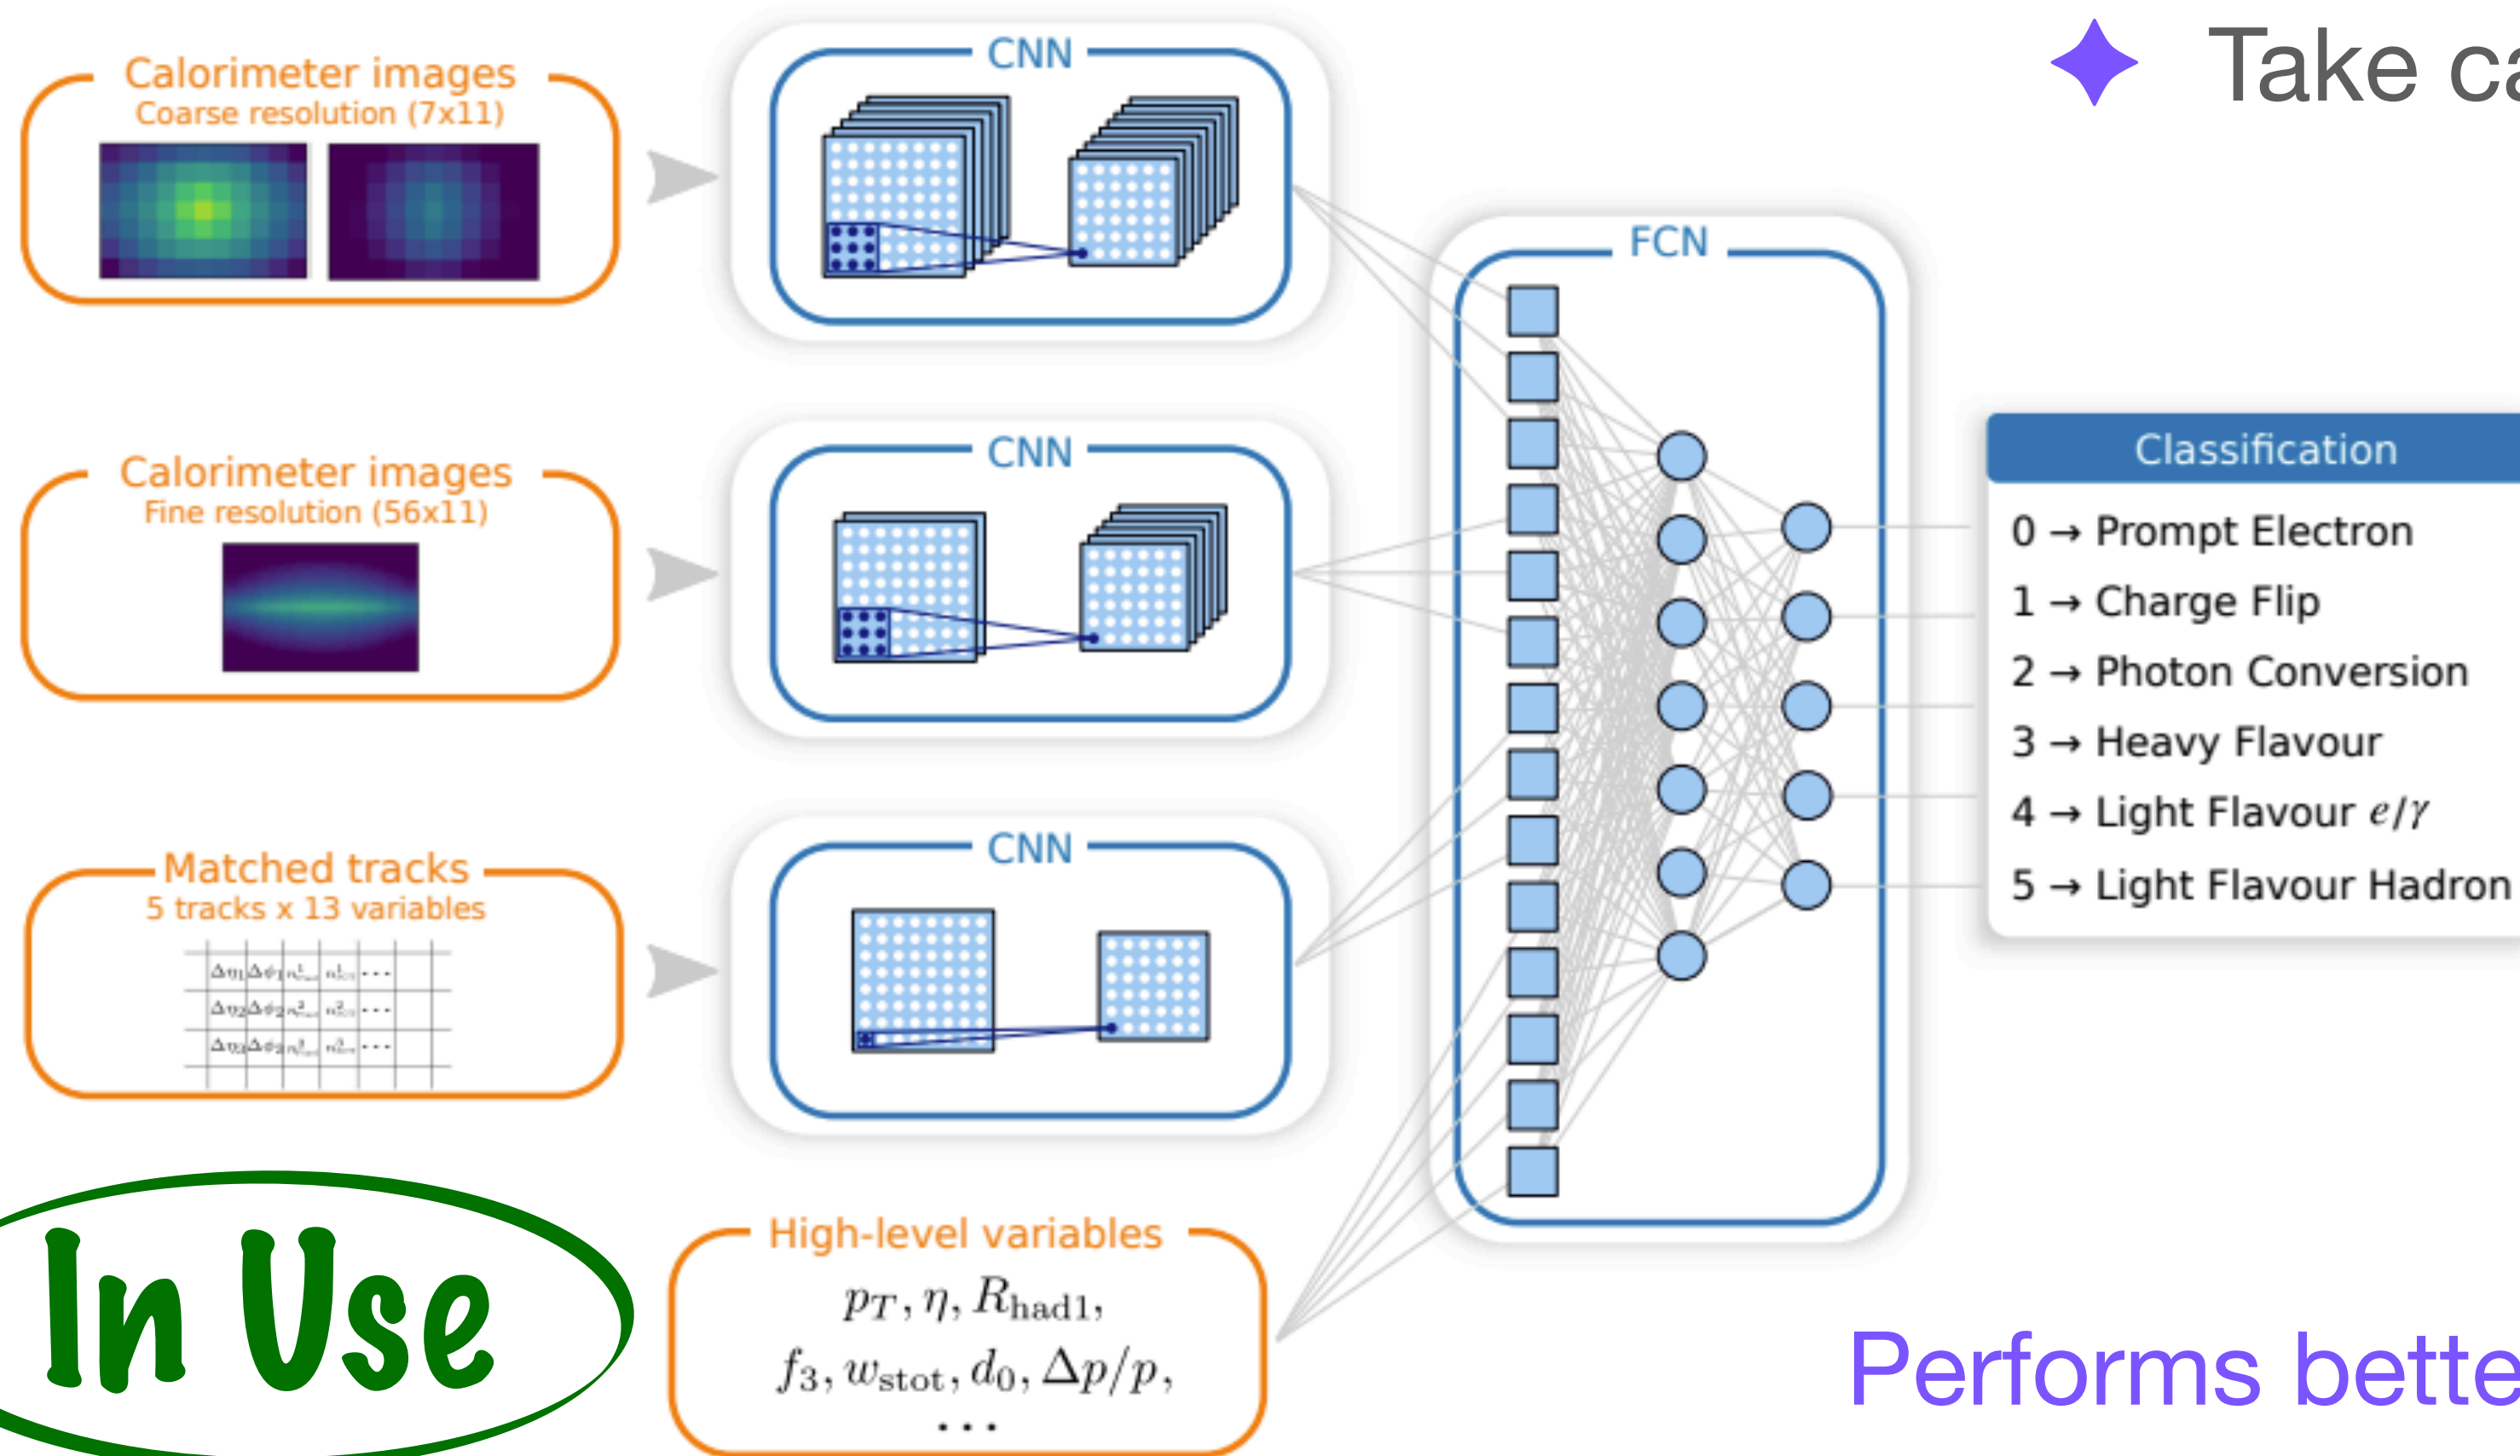

Particle identification

ATL-PHYS-PUB-2023-001

◆ Use **convolutional neural network** to perform a multi-class electron identification in pp

◆ Take calorimeter images + tracks as input

Performs better than likelihood methods (LLH)

➡ Including tracks helps with this!

Many examples of similar tools from other experiments!

Signal/background discrimination

Conventional approach: Apply cuts to tag particle based on decay topology

➔ Becomes difficult in HI environment with large background.

ML-Based approach: Use low-level parameters such as constituents, secondary vertices, track impact parameters etc. Learn from simulation in a supervised approach.

Most experiments implement this! Has made new measurements possible!

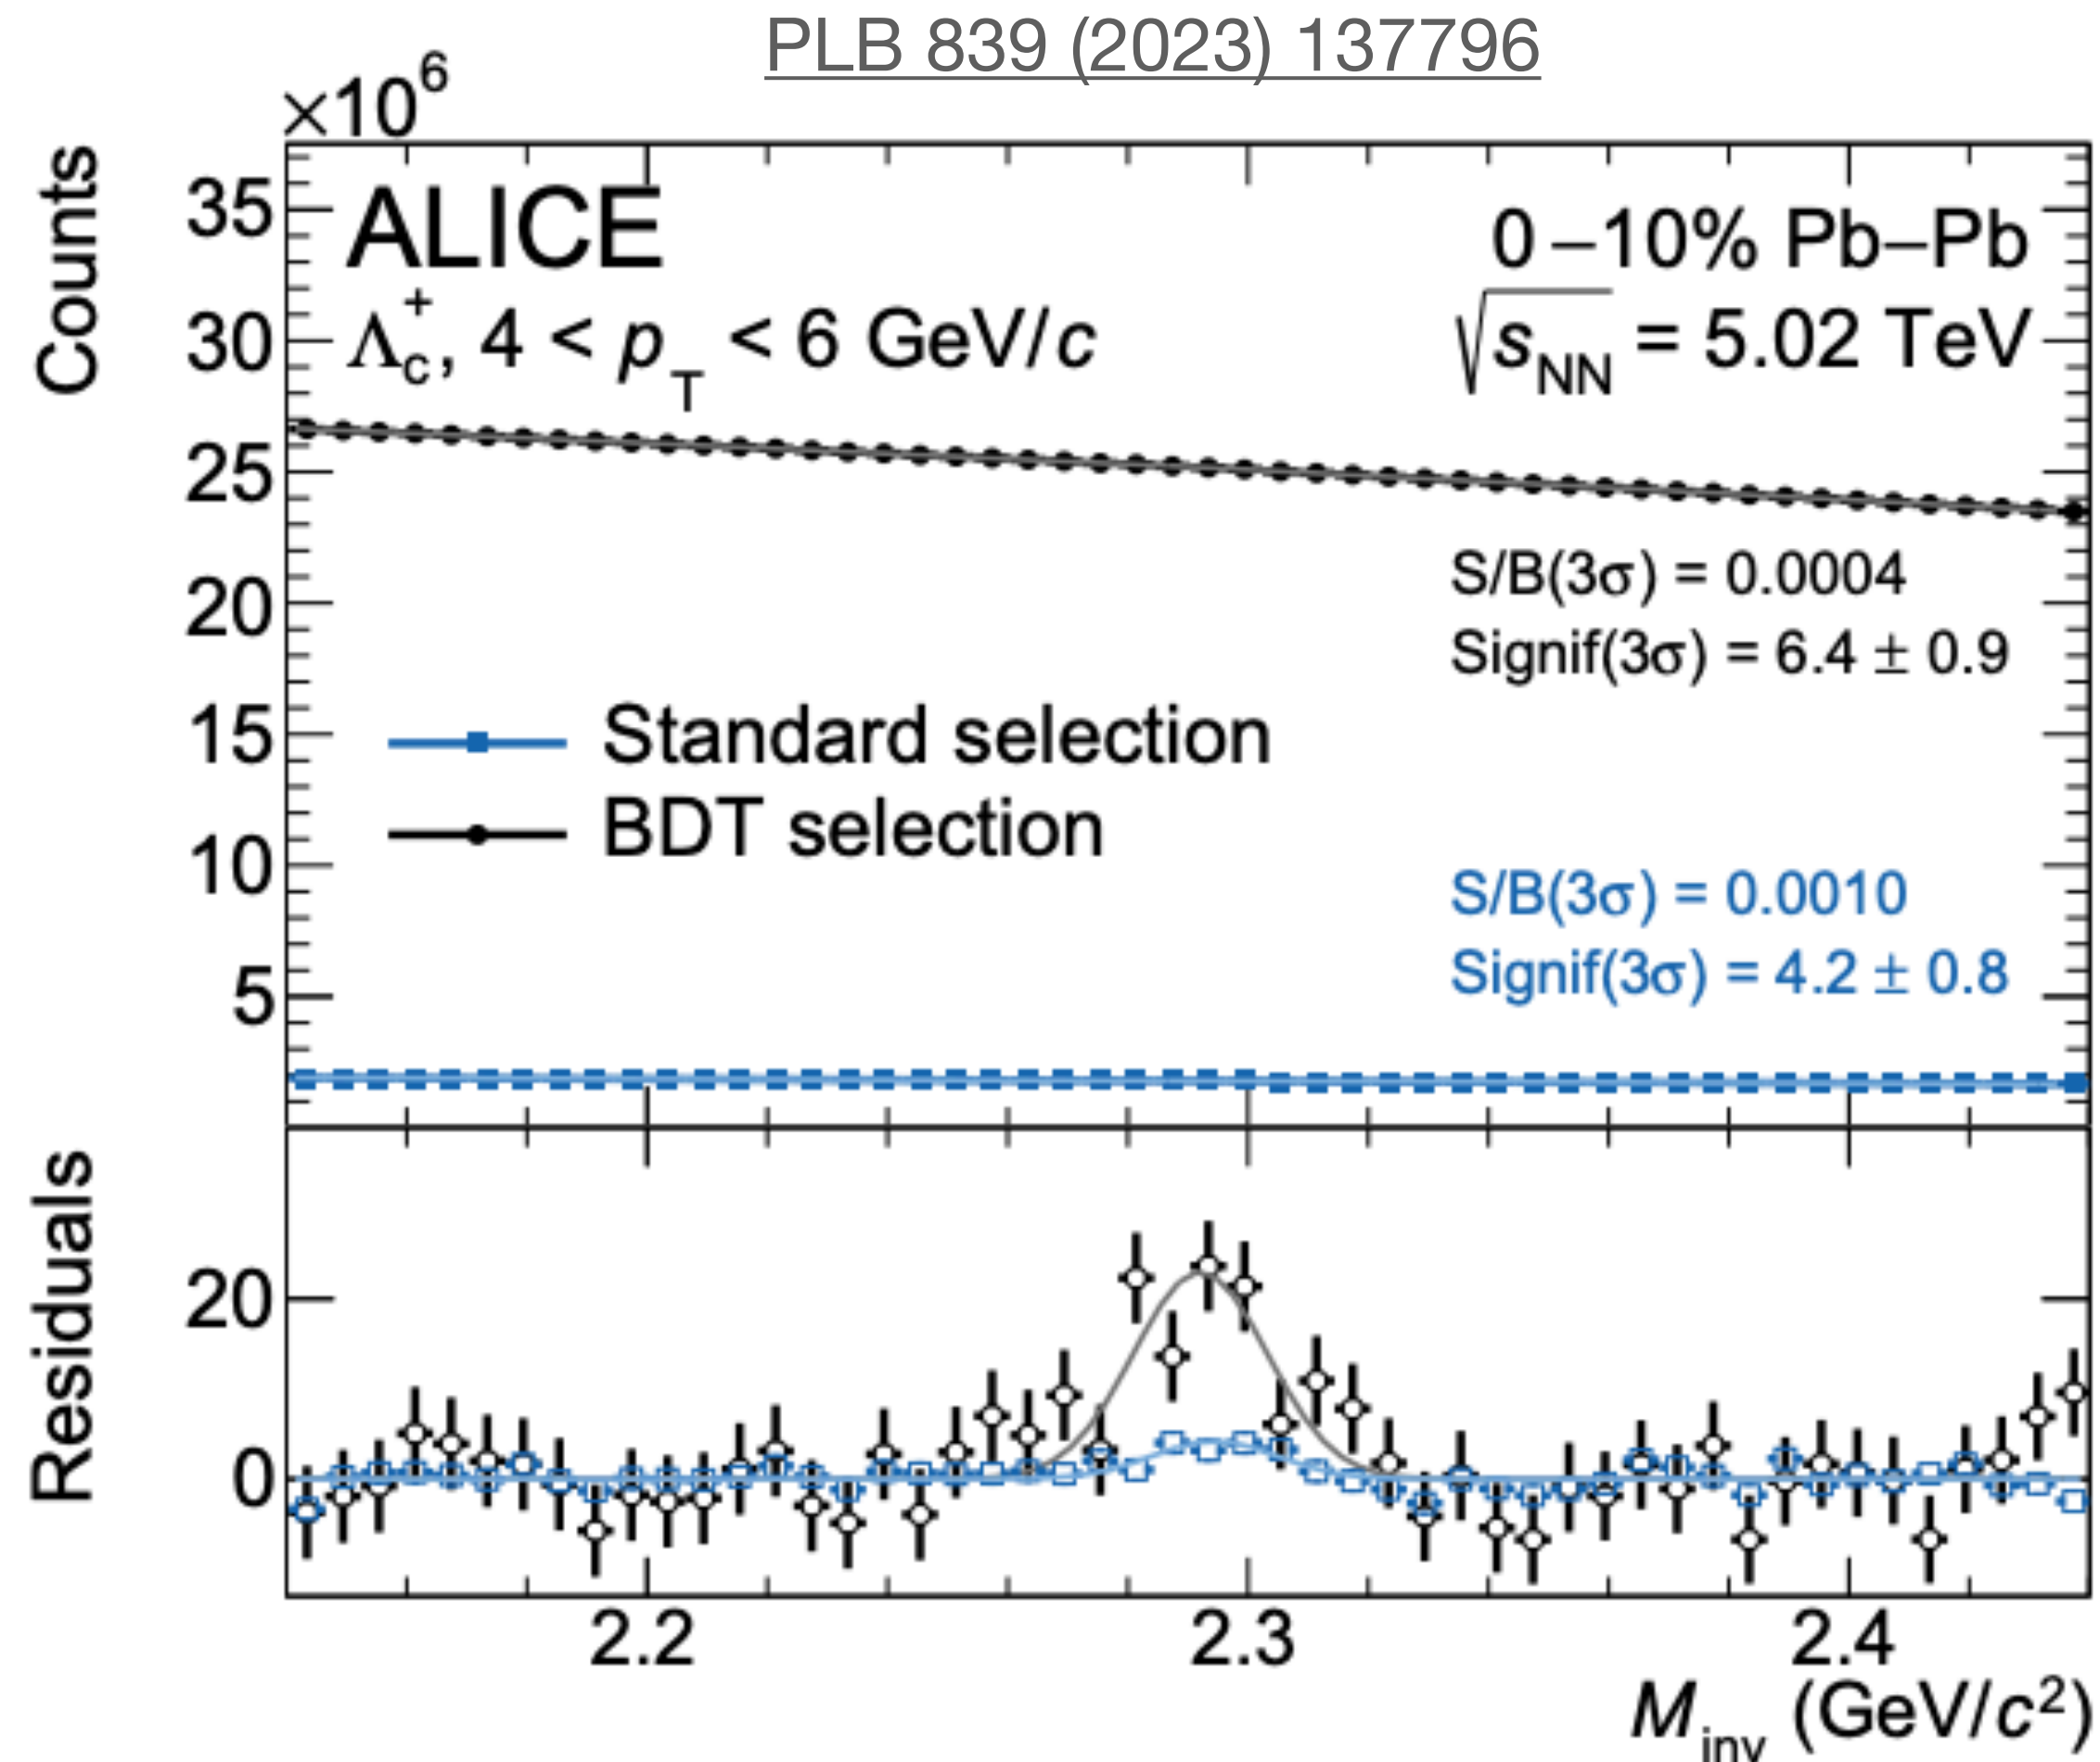

$$\text{Ex: } \Lambda_c^+ \rightarrow K_s^0 + p$$

Signal/background discrimination

ALICE

- ◆ ALICE: **Boosted Decision Tree** implemented in **XGBoost** using **hipe4ML**

- ◆ Supervised learning using MC simulations and topological and PID variables for training.

In Use

- ◆ ML helps increase the statistical significance by ~50% over standard selection!

Signal/background discrimination

CMS PAS HIN-21-016

- ◆ CMS: **Multilayer Perceptron** implemented in ROOT TMVA to optimize signal

In Use

- ◆ Supervised learning trained on PYTHIA embedded in EPOS LHC w/ input p and η for the protons, energy loss per length of proton track, cosine of pointing angle

- ◆ **Boosted decision trees** also common in CMS, see $\Upsilon(3s)$ ([arXiv:2303.17026](#)), B_c^+ ([PRL 128 \(2022\) 252301](#)), $X(3872)$ ([PRL 128 \(2022\) 032001](#)), and more!

Signal/background discrimination

PRL 124, 172301 (2020)

Traditional Techniques

With BDT

- ◆ STAR: **Boosted Decision Tree** implemented in ROOT TMVA to optimize signal
- ◆ Trained in supervised way with EvtGen.
- ◆ 50% increase in signal significance with ML!

Jets as a playground for ML

Parton Shower Hadronization

Image Credit: <https://arxiv.org/abs/hep-ph/0210294>

→ Jets are the spray of particles that result from the fragmentation and hadronization of a hard-scattered parton

→ Complex aggregate object sensitive to multiple physics scales (ideal for ML)

Jet physics has been a playground for ML developments! Many associated tasks, possible representations (ex: images, constituents, single object) and information reach.

Heavy flavor jet tagging

JINST 13 (2018) 05, P05011

Goal: identify jets initiated by a heavy-quark (HF jet)

Conventional approach: Apply cuts to select jets with displaced decay vertices and large impact parameter tracks.

ML approach: Use low-level jet parameters such as constituents, secondary vertices, track impact parameters etc to learn from simulation in a supervised approach.

Some approaches independent of experiments! (see JetVLAD).

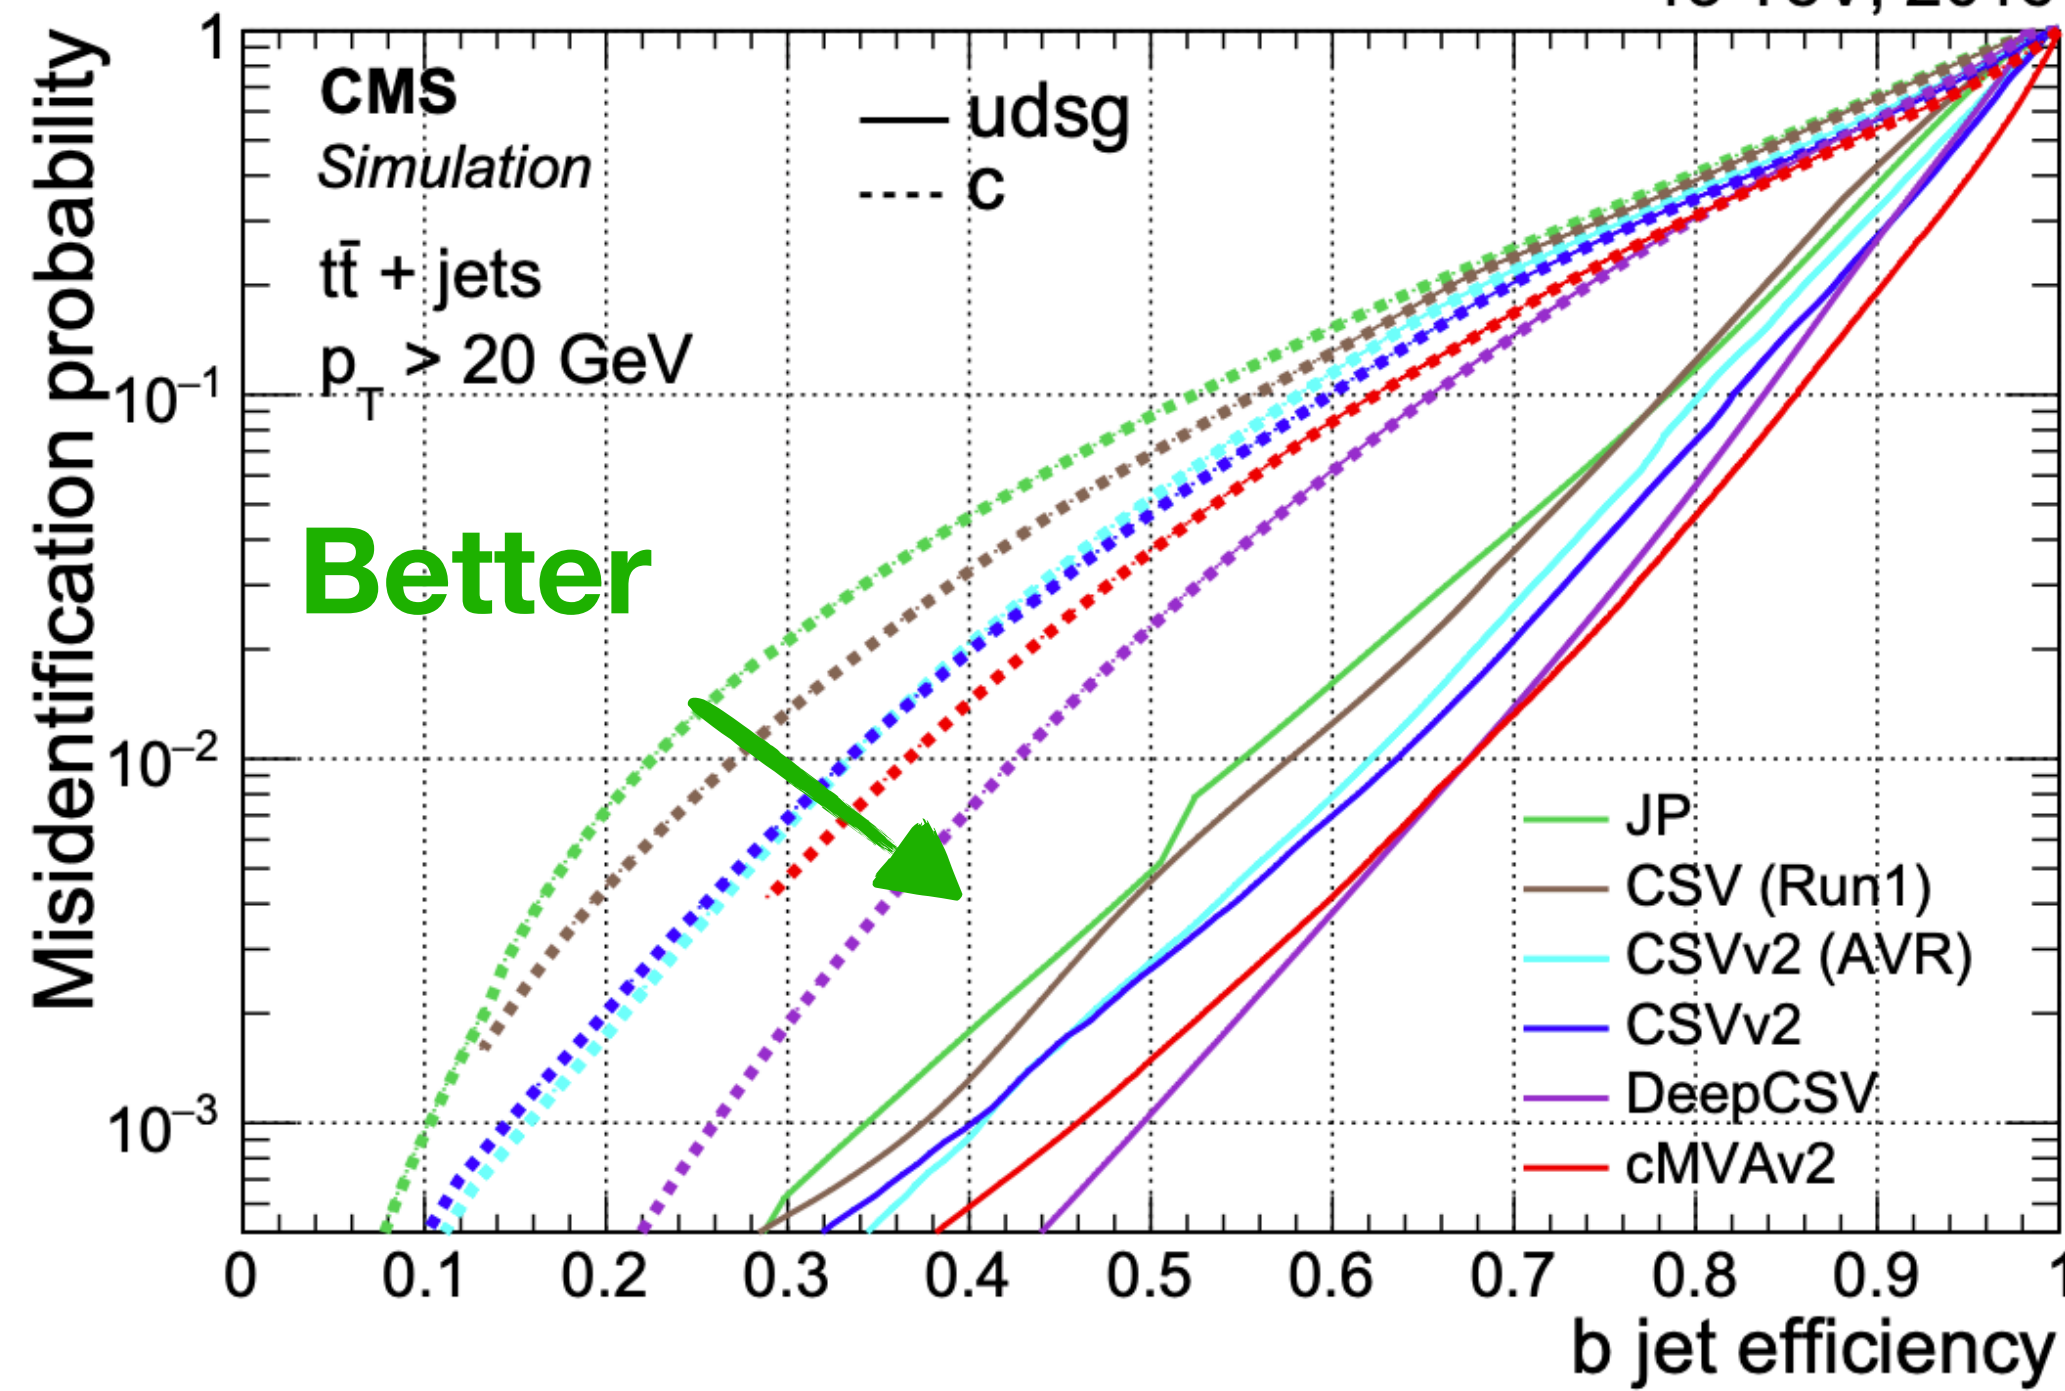

HF-jet tagging

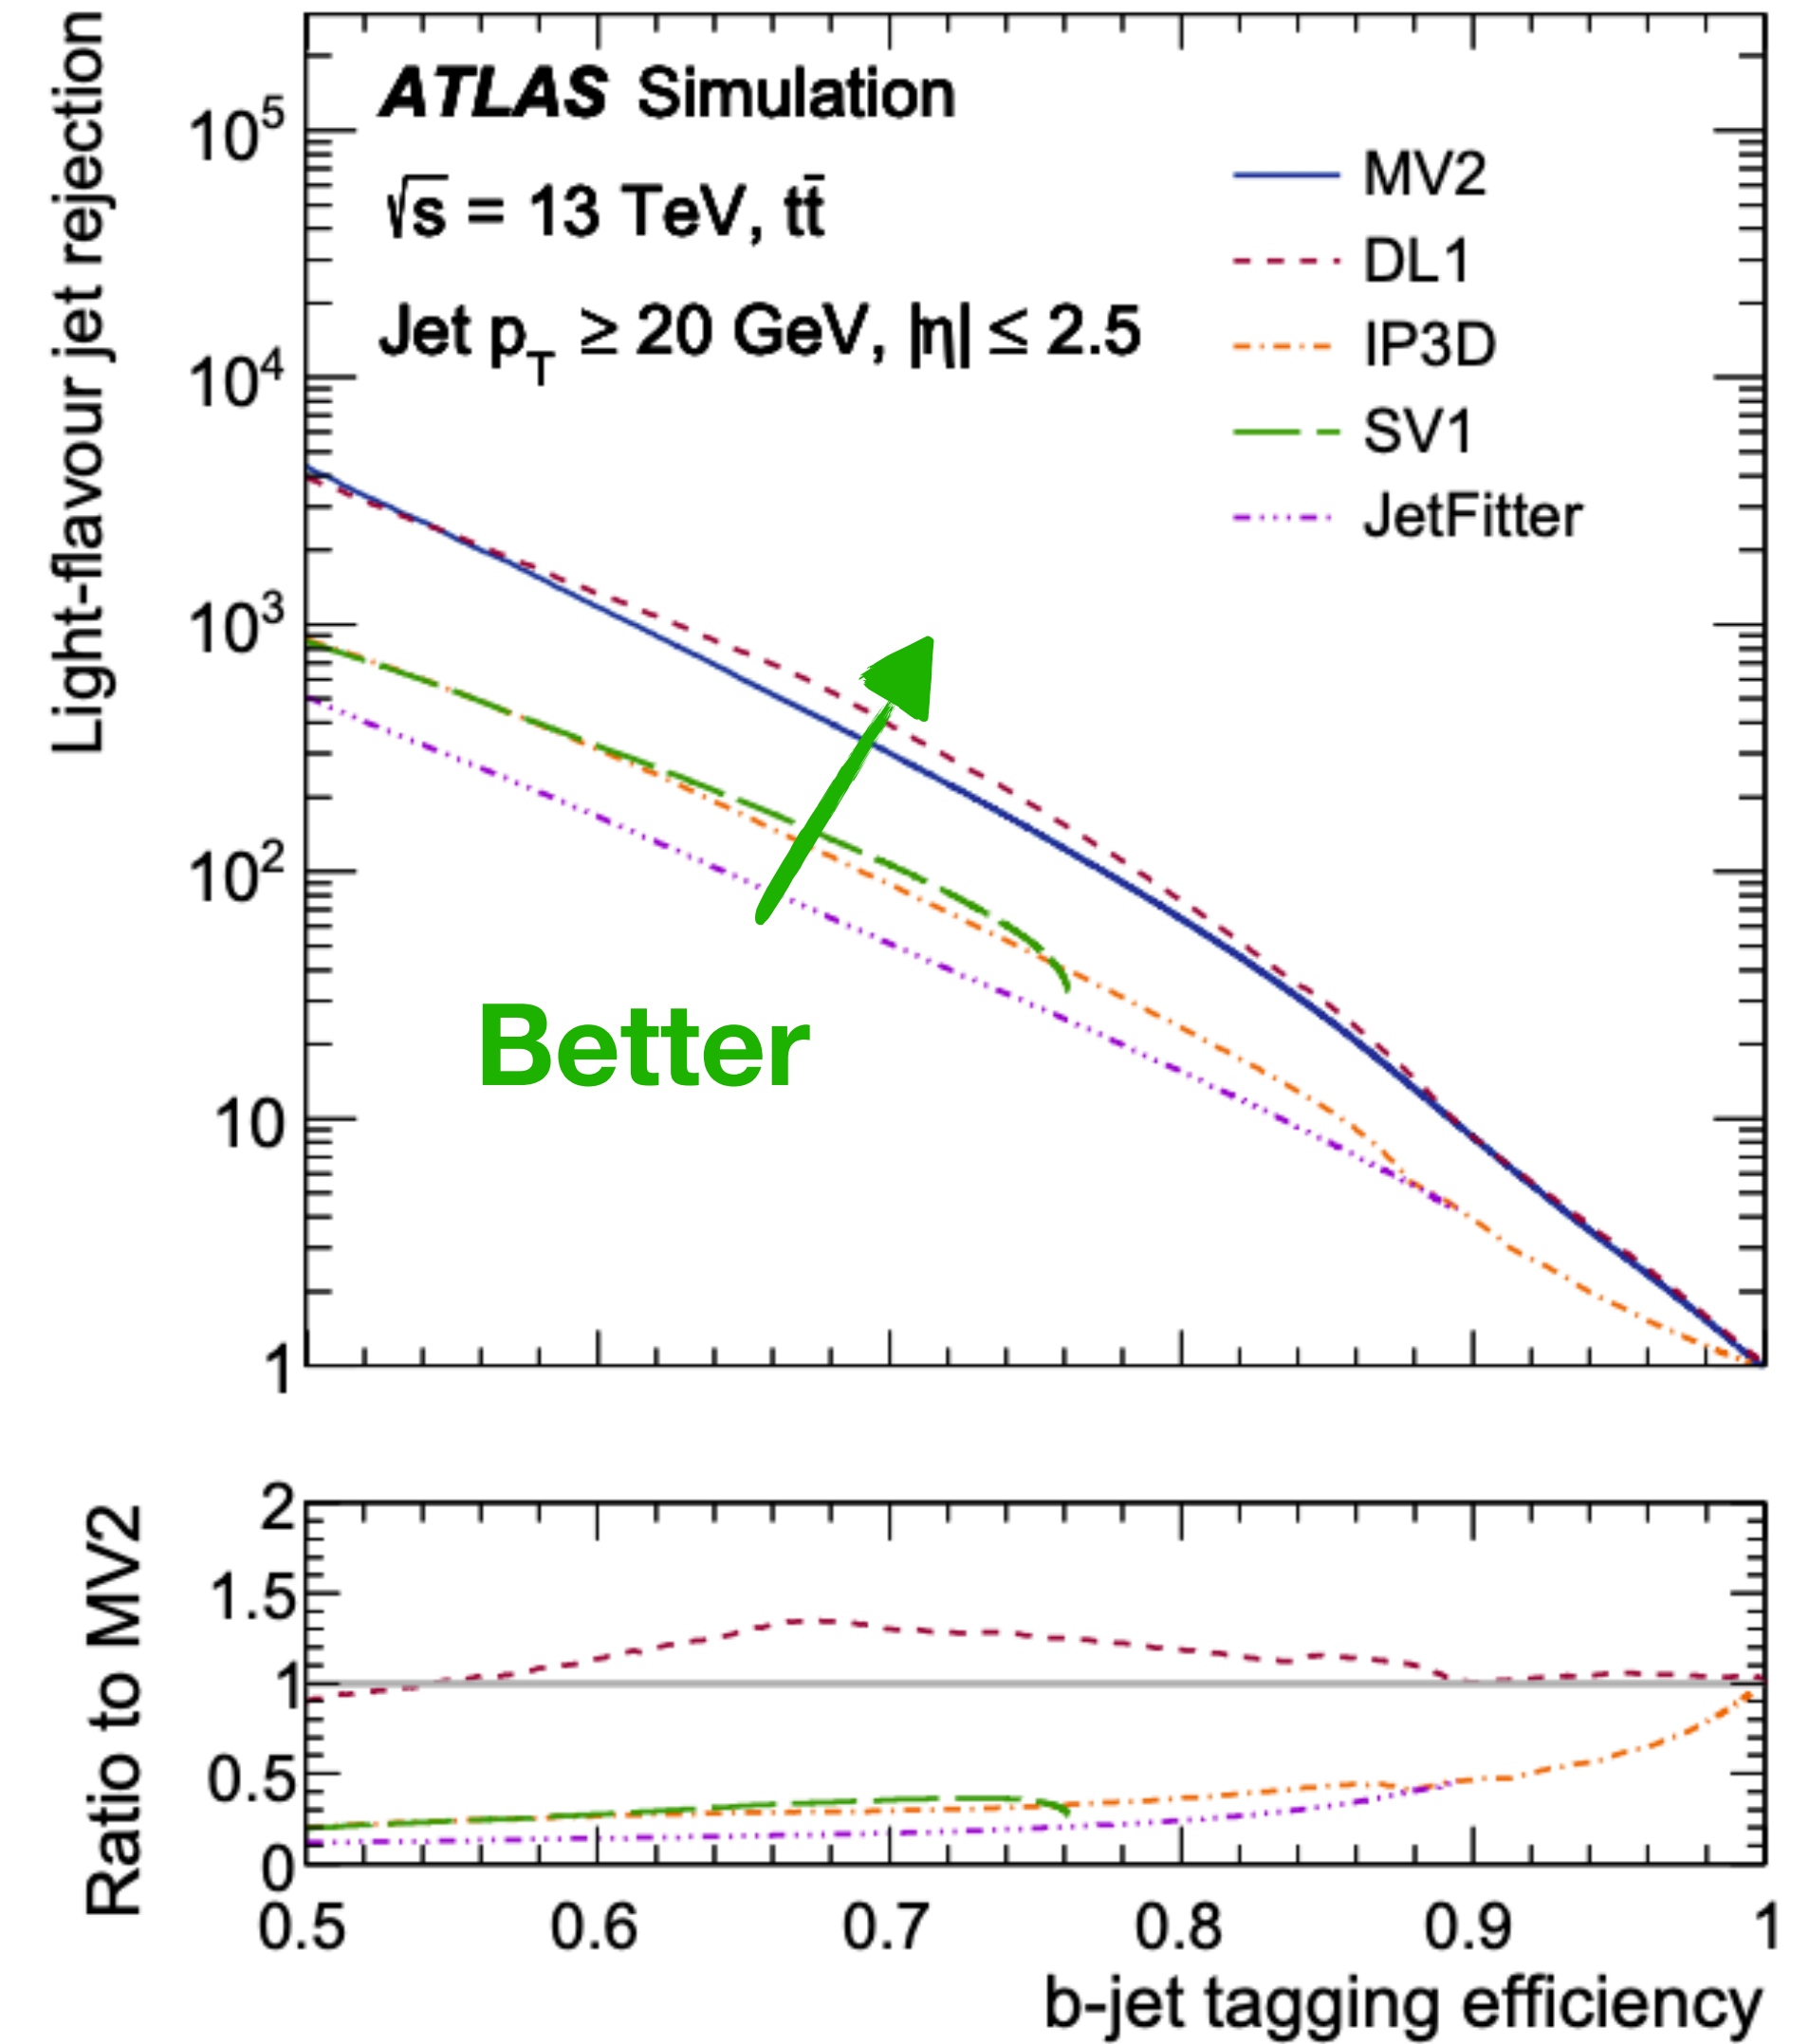

In Use

JINST 13 (2018) 05, P05011

13 TeV, 2016

Eur. Phys. J. C 79 (2019) 970

ATLAS and CMS both see that deep learning performs better than traditional techniques!

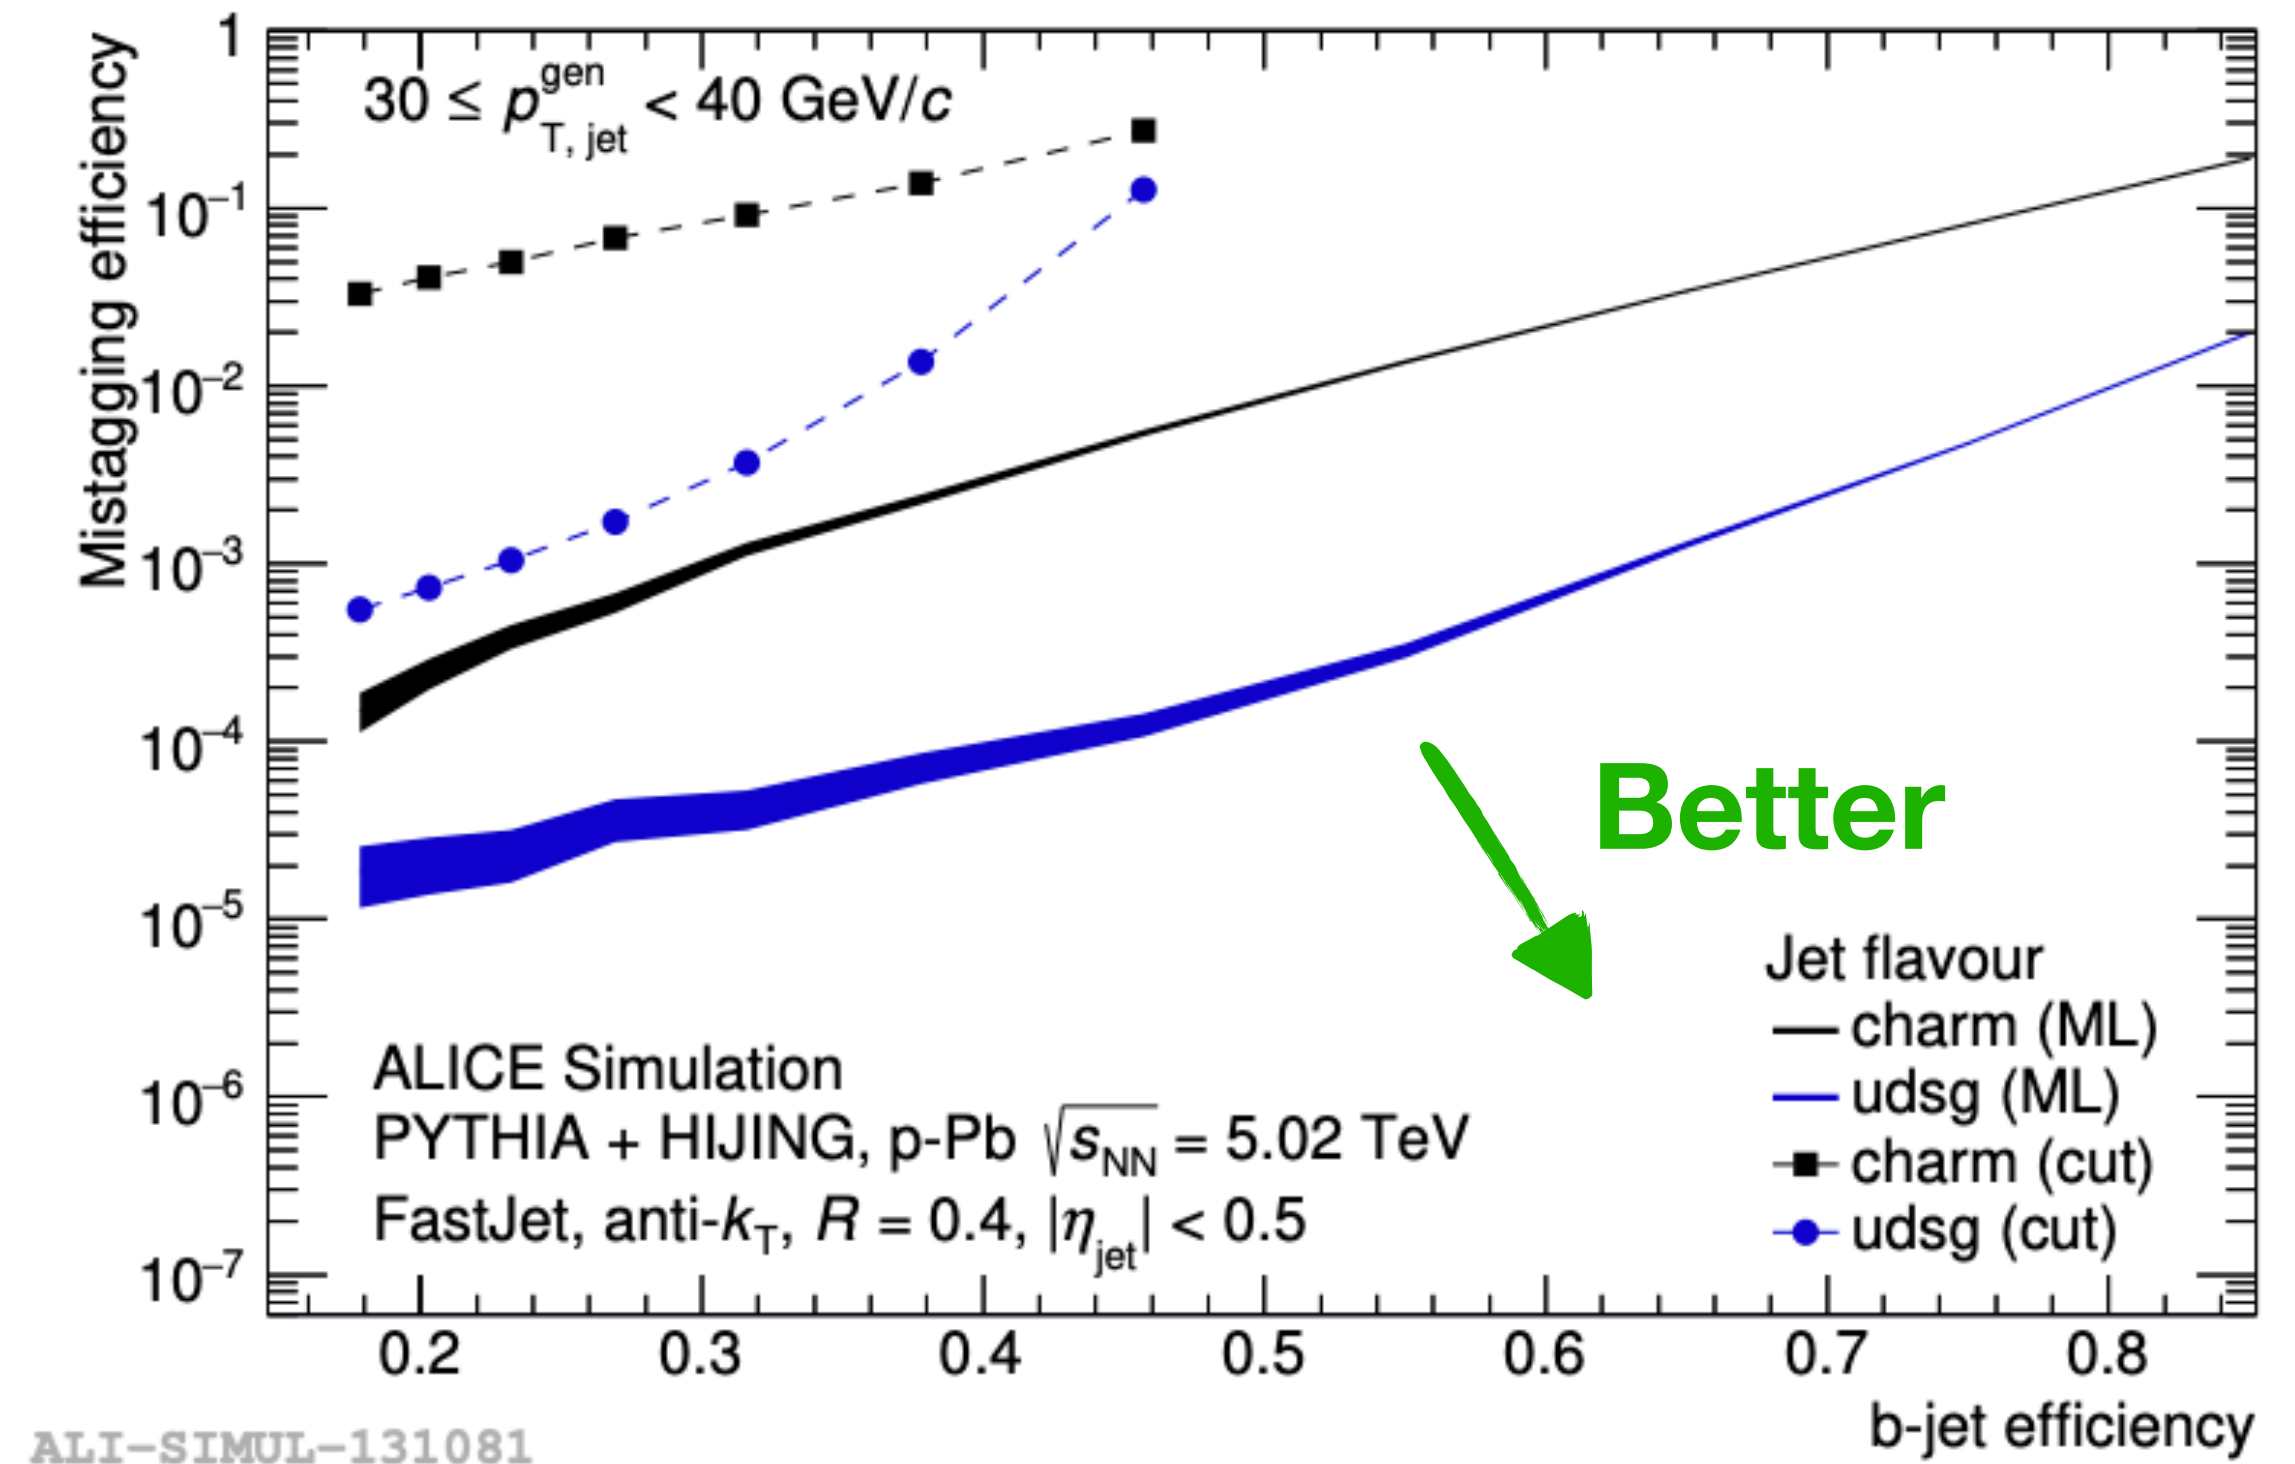

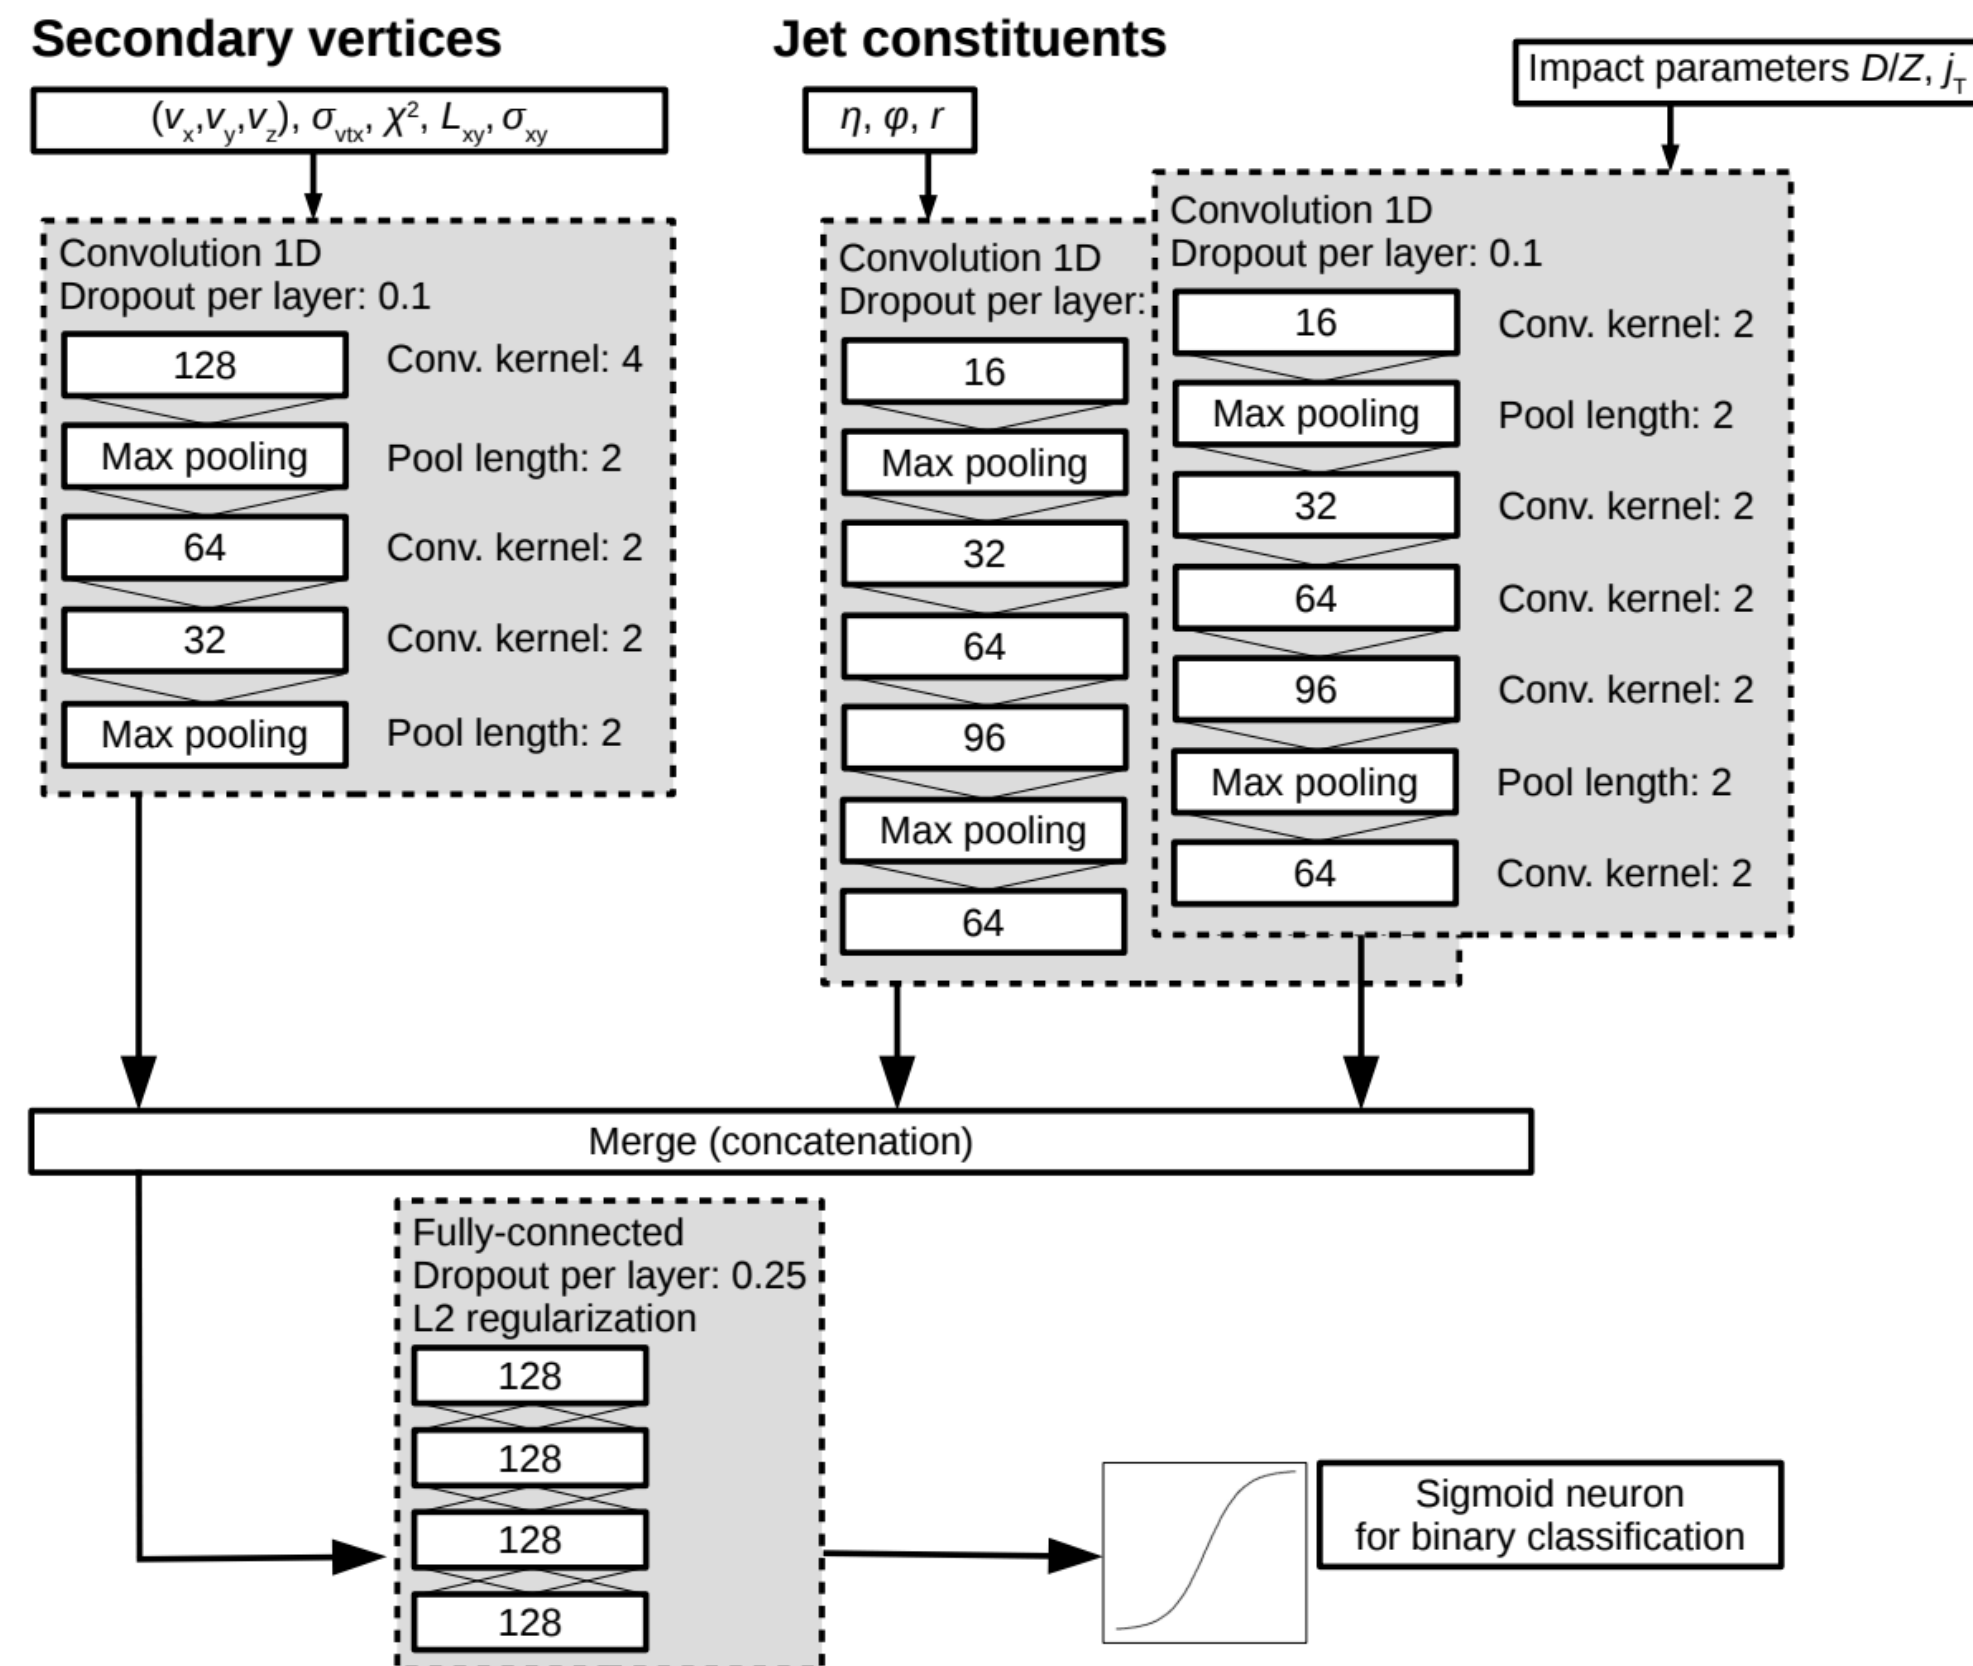

HF-jet tagging

Testing

ALICE: Use multi-layer **Convolutional Neural Network**.

arXiv:1709.08497

Mistagging efficiency lower for all b-jet efficiencies with ML!

Correction to the jet p_T

arXiv:2303.00592, submitted to PLB

$$\delta p_T = p_{T,\text{rec}} - p_{T,\text{true}}$$

Shallow Neural Network in [scikit-learn](#)
(simple tools) trained on PYTHIA
embedded into HI background

[R.Haake, C. Loizides Phys. Rev. C 99, 064904 \(2019\)](#)

In Use

Supervised regression task: Use
properties of the jet and its
constituent to determine the
background-corrected jet p_T

Shows improved performance over standard techniques → allows measurement to lower
in jet p_T and larger in R .

Study of fragmentation bias

ALICE

arXiv:2303.00592, submitted to PLB

- ➔ Address dependency on fragmentation in simulation introduced by including constituent information
- ➔ Temporary solution: use toy modifications to demonstrate sensitivity to the training.

Fractional large angle

Fractional collinear

Medium Response

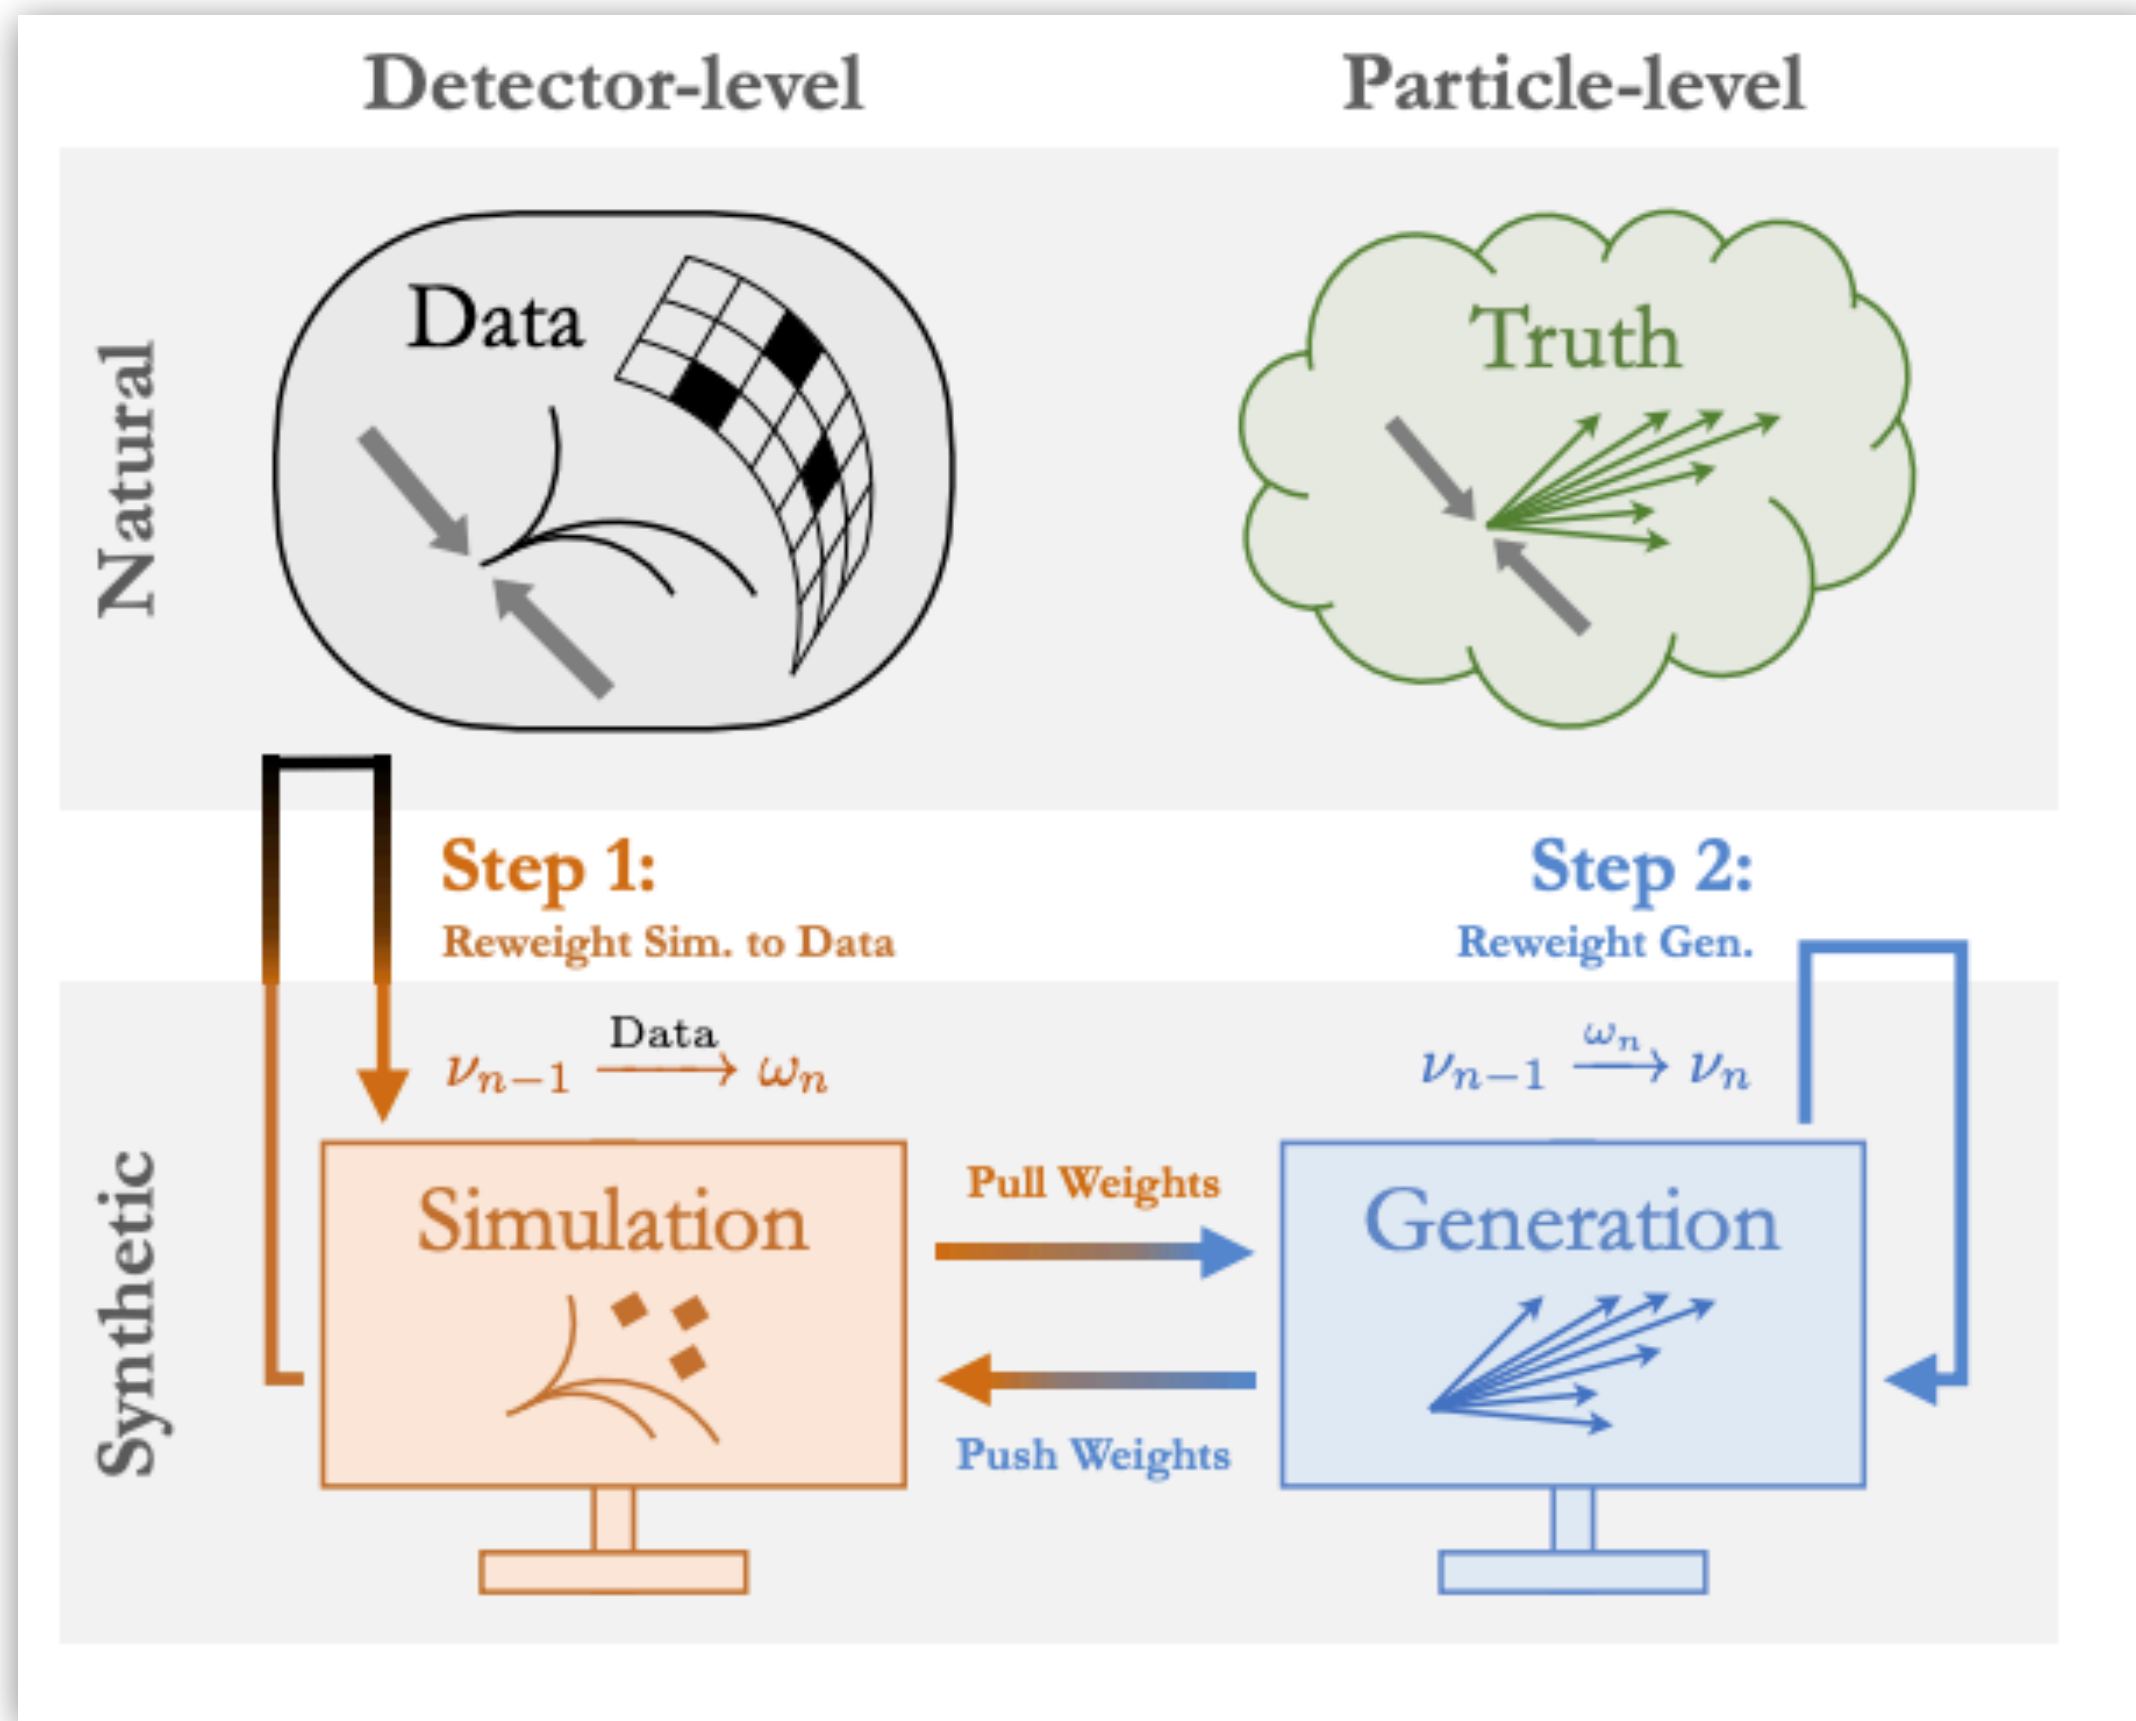

Apply difference in result as systematic uncertainty.

Unfolding with ML

➔ **Goal:** Correct for detector effects and background fluctuations

Phys. Rev. Lett. 124, 182001 (2020)

Conventional Approach: Apply unfolding procedure on a binned distribution and repeat for each observable.

ML-based Approach: Use ML to calculate weighting factors and unfold the phase space all at once, before the choice of binning or observable!

Main-benefit is multi-dimensional unbinned measurements! Can measure correlations between variables.

Experimental applications

STAR

See Dave Stewart's talk tomorrow @ 3:00pm!

In Use

LHCb
 $\sqrt{s} = 13 \text{ TeV}$, 1.64 fb^{-1}
forward Z+jet

arXiv:2208.11691

ALEPH
archived data,

Badea

Outline

What is AI/ML and why is it useful for heavy-ion physics?

How is AI/ML currently being used by HI experiments?

How will AI/ML be used in the future?

Where are we going?

Large Hadron Collider

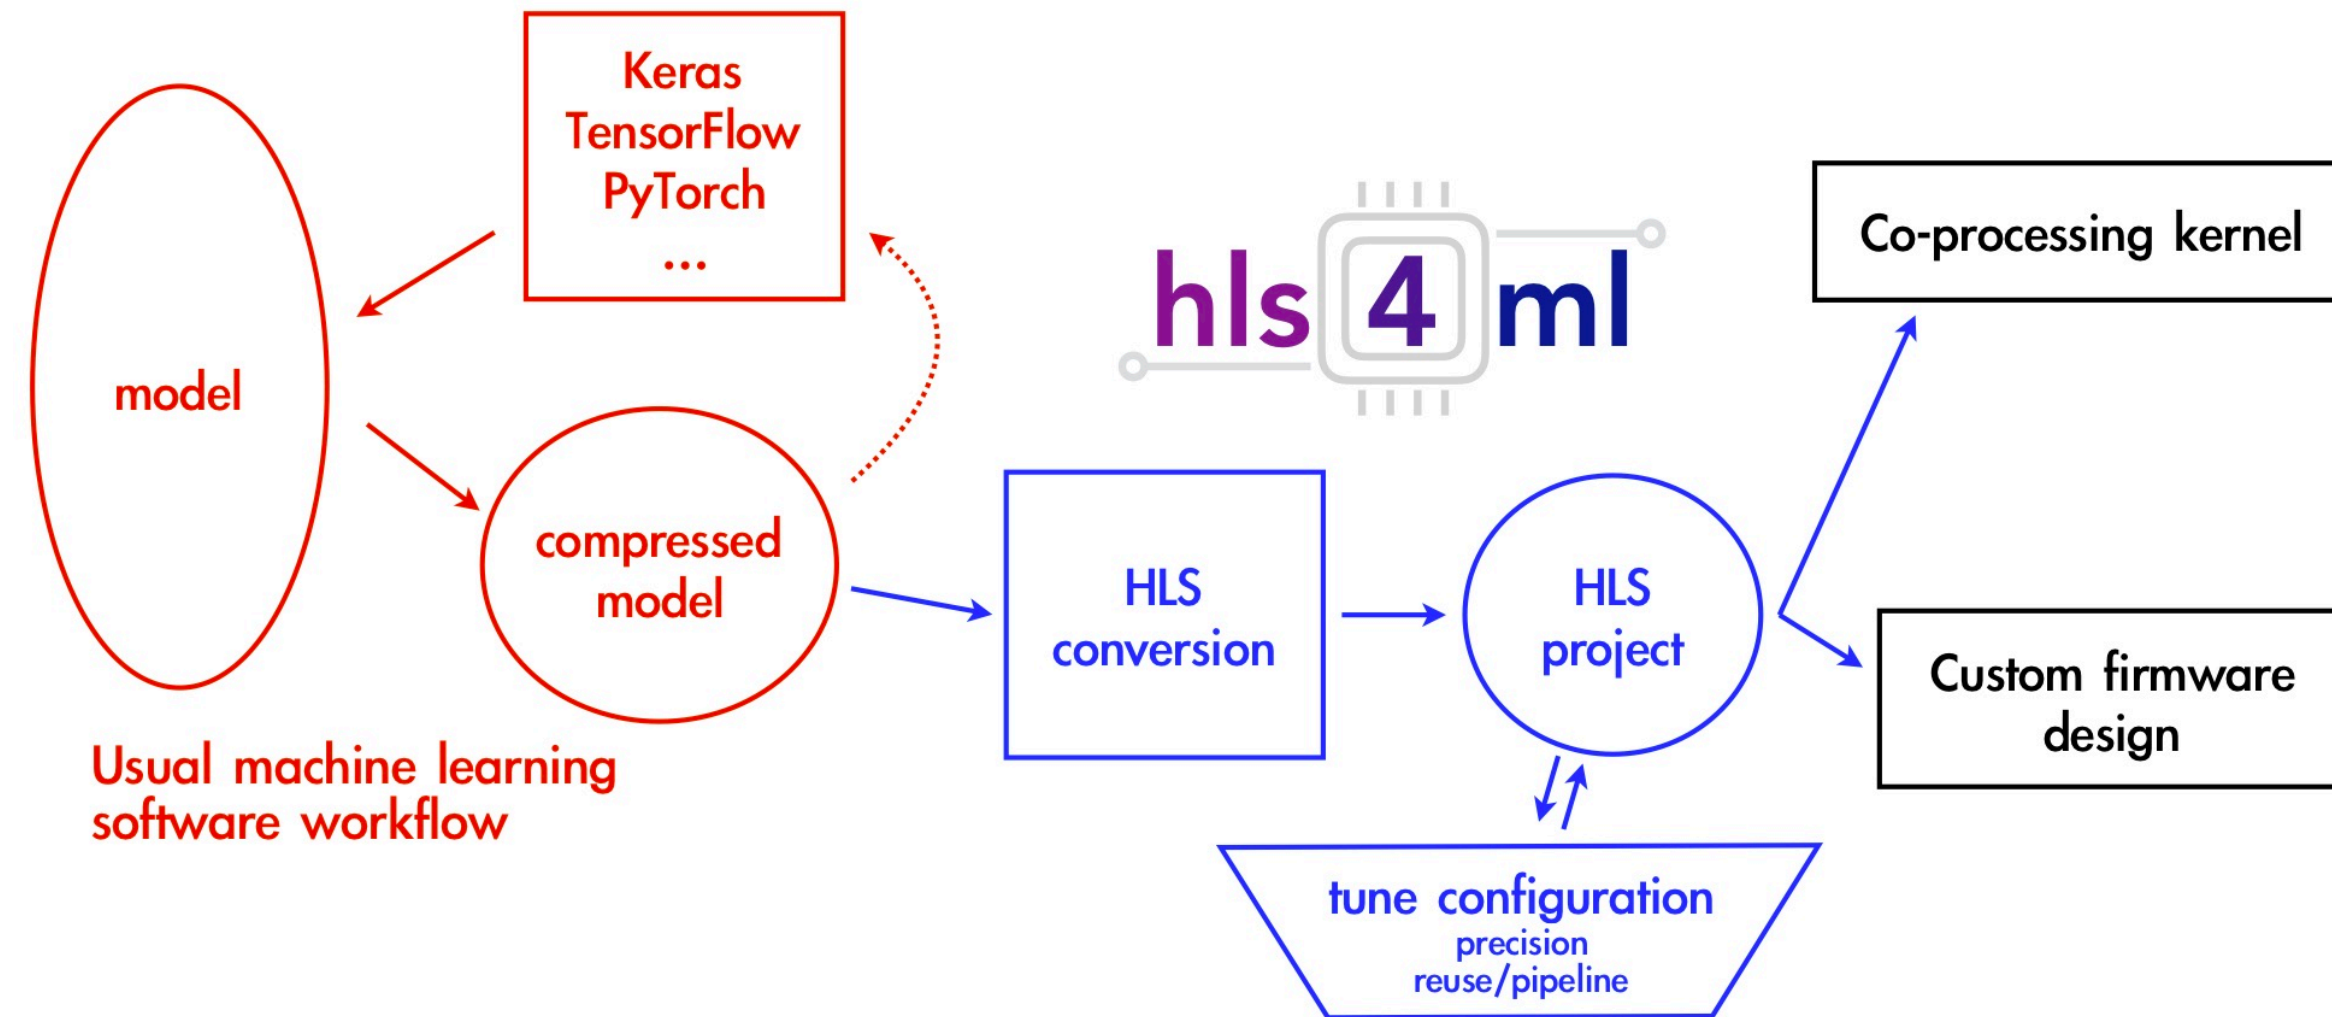

Electron Ion Collider

Relativistic Heavy Ion Collider

Very large volumes of data being taken - new tools will be increasingly important!

Hardware triggers with ML

Future

<https://github.com/fastmachinelearning/hls4ml>

➡ Due to limited computing resources, will require rejecting most (~99%) of data in real time!

Solution: perform selection with ML integrated into firmware using Field Programmable Gating Arrays (FPGAs).

◆ Use **hls4ml** to translate models into FPGA bitstreams!

Potential test in pp data-taking

Use from day 1!

ML at the EIC

➔ Futuristic detector being designed with futuristic techniques in mind!

Ongoing Activities w/ AI

- ◆ Detector design (see backup)
- ◆ Simulation
- ◆ Reconstruction
- ◆ PID
- ◆ Analysis

See [AI4EIC workshop](#) for more!

In Use

Testing

Future

Future Activities: Streaming readout/control

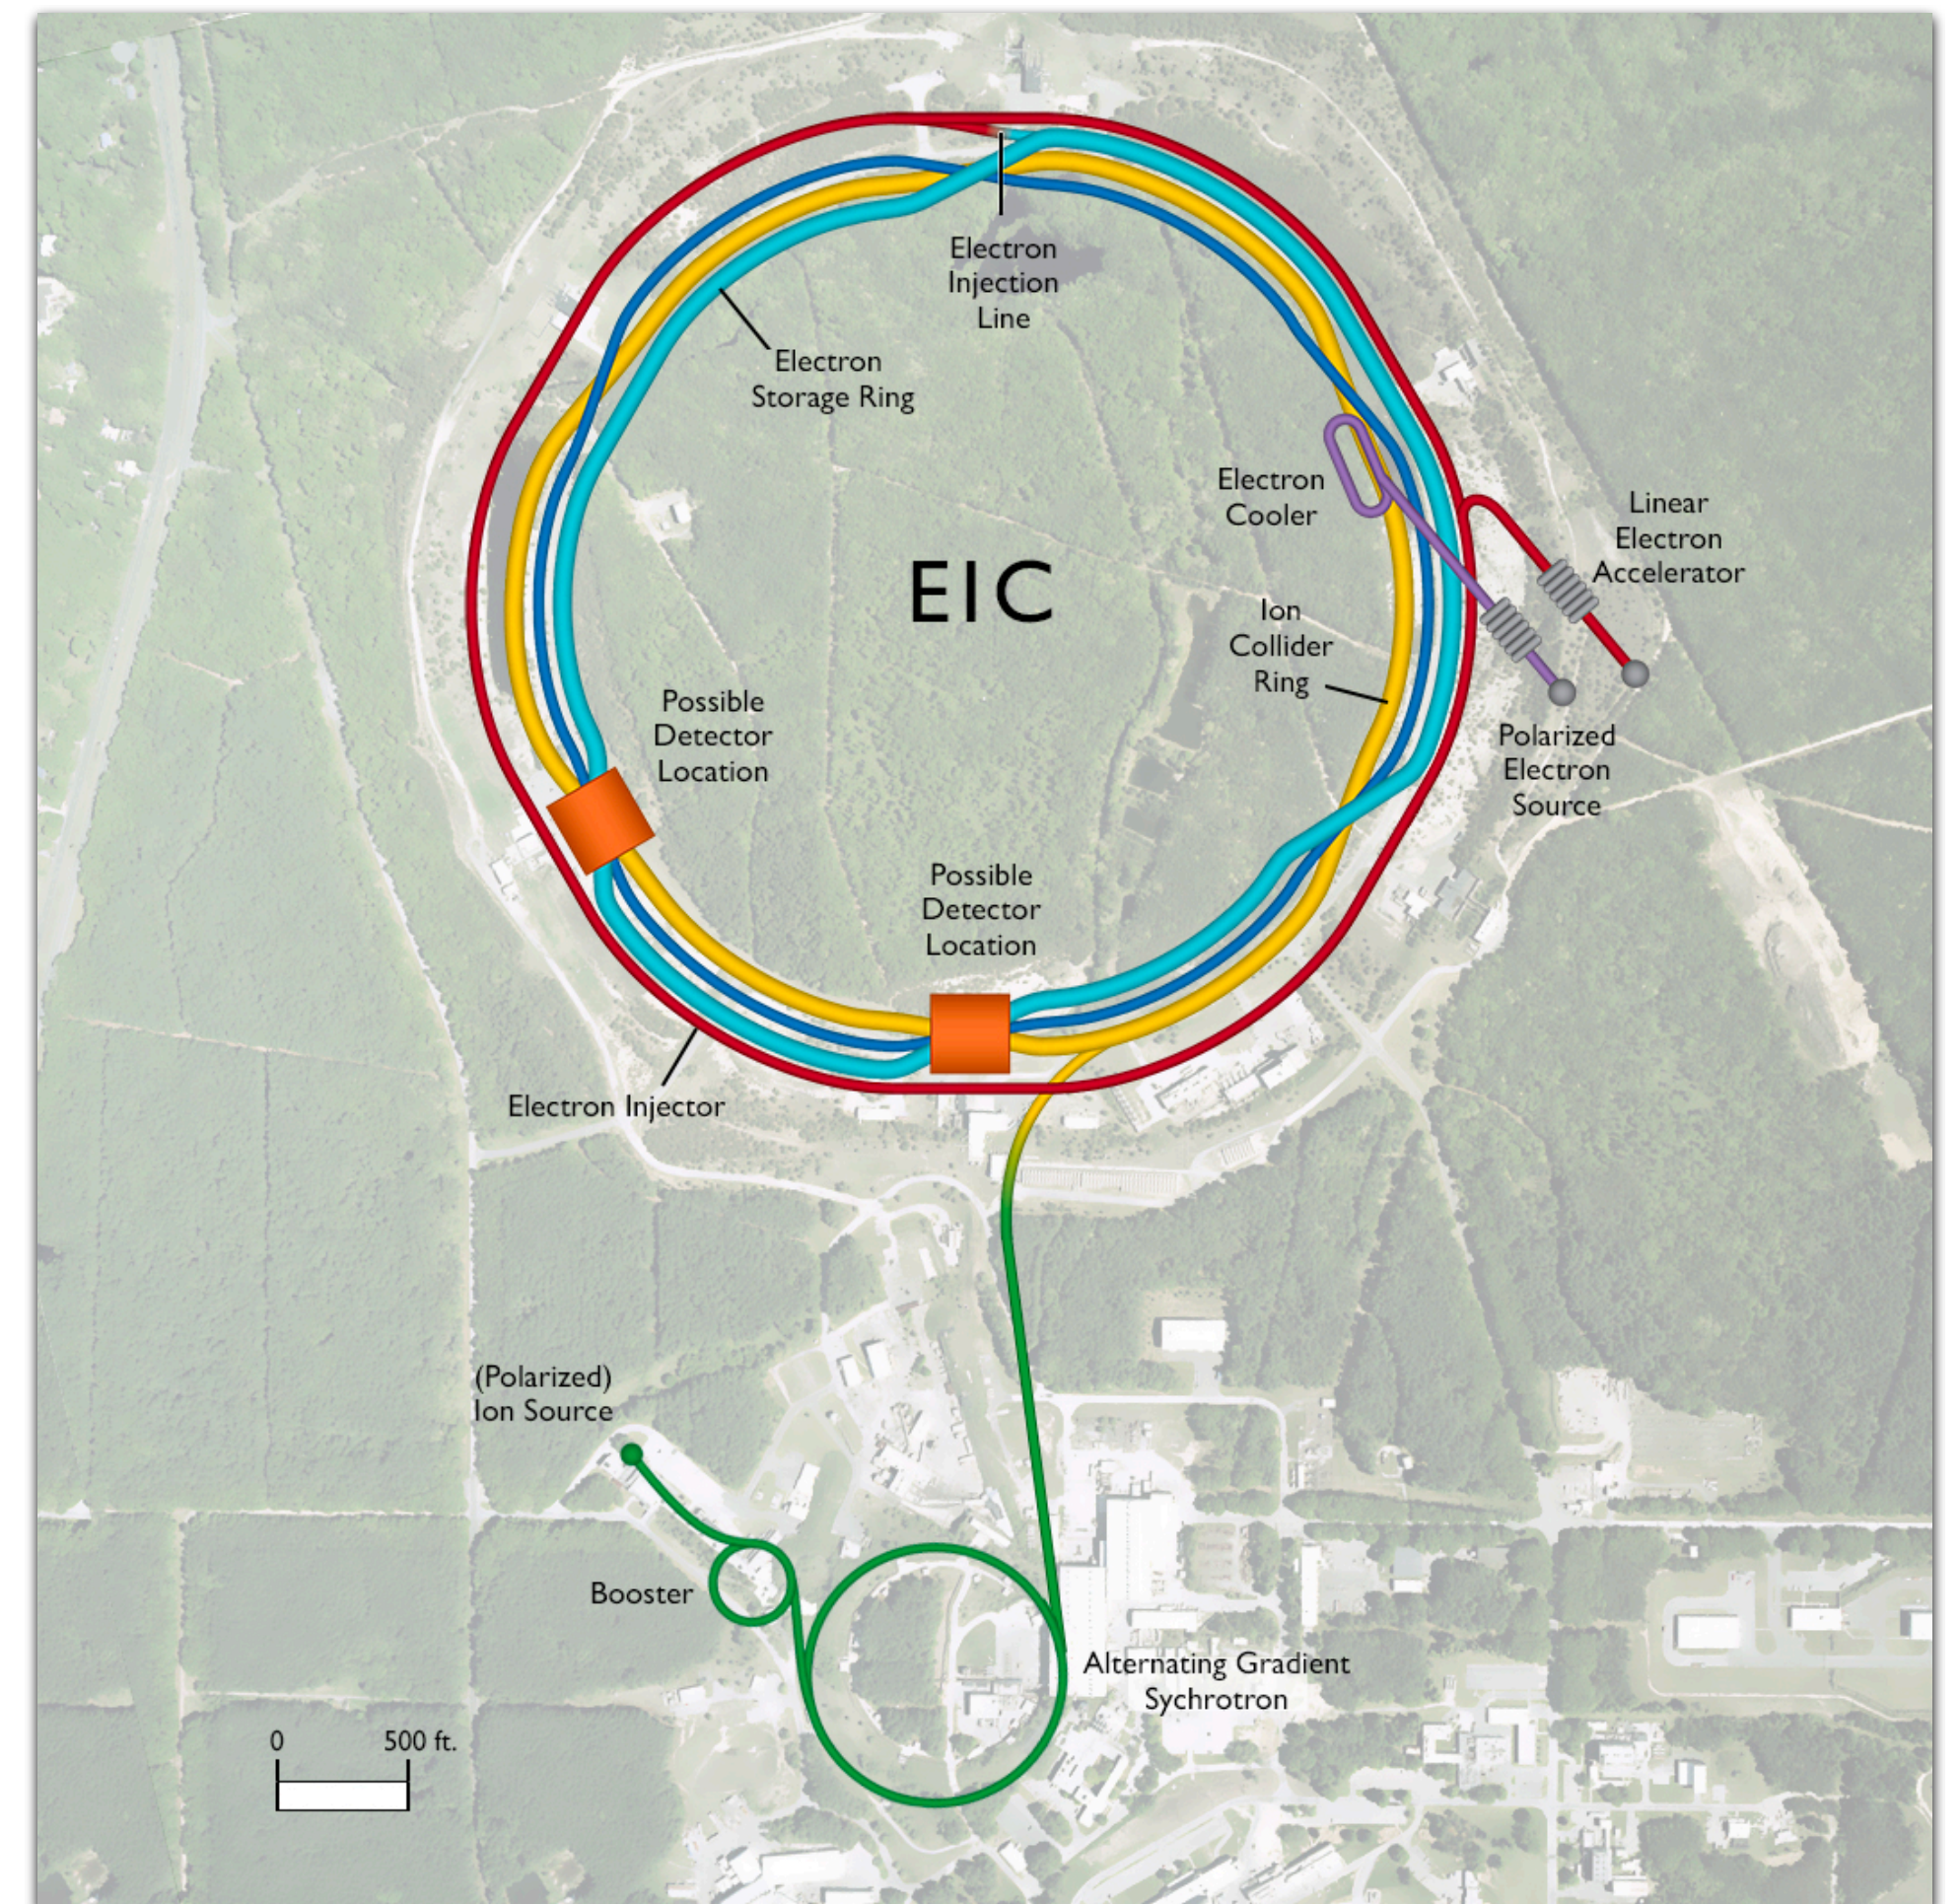

Image Credit: Brookhaven National Lab

Track reconstruction at the HL LHC

- ➔ Data volume and reconstruction will also be a problem for the HL-LHC
- ➔ Reconstructing charged particle trajectory is computationally expensive - scales with detector occupancy.

Standard approach: Kalman Filter used to locate hits in charged particle trajectory

ML-based approach: Use ML tools to speed this up such as...

◆ **Recurrent Neural Network:** [arXiv:2212.02348](https://arxiv.org/abs/2212.02348)

◆ **Convolutional Neural Network:** [See Here](#)

ML for underlying physics

Could we use ML to directly access underlying physics mechanisms?

“Data”-based learning complements simulation-based inference.

- ~ Given an answer
- ~ “White Box” ML
- ~ Underlying physics

- ~ Domain knowledge
- ~ “Black Box” ML
- ~ Answer

This is a long term effort!

Learning from data is difficult due to systematic experimental biases.

Future

Helpful in understanding uncertainties or shortcomings of models!

Proof of concept

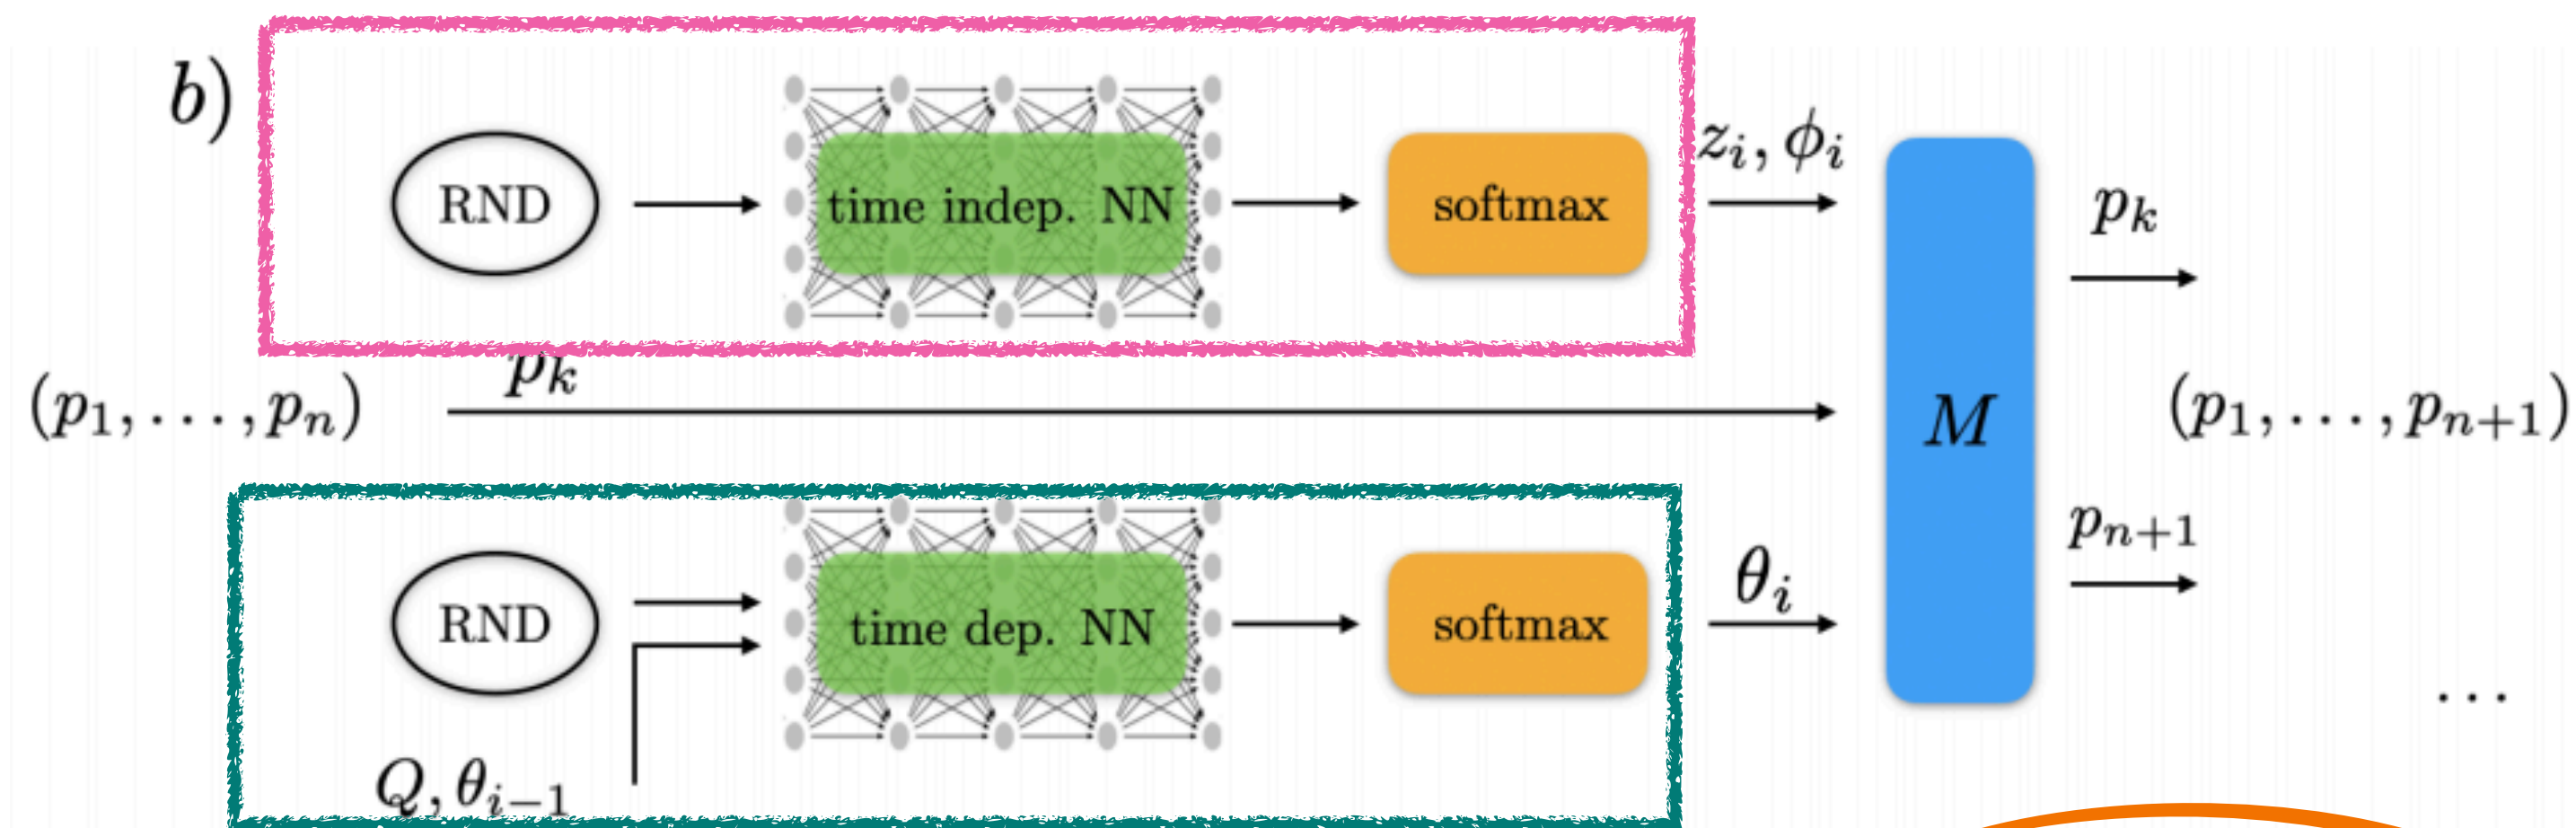

PLB 829 (2022) 137055

➔ Extract splitting function from the network in white-box ML.

Done with a Generative Adversarial Network split into two components.

1. Time independent learns the z, ϕ

2. Time dependent learns the θ

Testing

➔ Was able to reproduce AP splitting function.

Focus for next 5ish years

How do we quantify uncertainty?

How can we construct more interpretable models?

Do we need to standardize ML applications across experiments?

Continue to develop deep/advanced techniques tested on simulations!

Conclusions

- ➔ We are taking more data and making more complex measurements than ever before!
- ➔ Machine learning and its use in heavy-ion experiments is becoming increasingly important!
- ➔ Lots of great experimental progress through the whole data analysis pipeline!

Future is very bright!

Resources & Future Workshops

This was a brief and biased overview! Many great conferences/workshops!

✦ For more ML at this conference, see also Kai Zhou's talk on Thursday at 16:30 and Henry Hirvonen's talk tomorrow at 17:30! (More theoretical)

ML4jets 2023 was just announced!
Abstracts due September 10th!

Resources Hub For Machine Learning

Here is a collection of resources that I've found helpful in order to learn about machine learning and explore its applications for jet measurements! Feel free to distribute this guide to anyone who may be able to benefit from it! If there are any resources that you would like to see included in this list, email me at hannah.bossi@yale.edu and I will happily add them! Enjoy! ~ Hannah

Resources to Learn About ML in General

Overview Websites

Conferences/Meetings

Resources to Learn About ML Applications in Jet Physics

Overview Websites

➔ To learn about ML see resource guide!

Thank you!!

The background is a complex, abstract composition. It features a dense network of thin, light purple lines that radiate from a central point, creating a sense of depth and movement. Overlaid on this are several 3D bar charts in various shades of purple and blue, some of which are semi-transparent. The overall color palette is dominated by purples and blues, giving it a technological or digital feel.

Backup

Types of learning

Supervised Learning

Algorithm learns from a labeled set of “true values”.

Driven by the Task

Analogy: Taking a test

Unsupervised Learning

Algorithm finds structure in the data without knowing the desired outcome.

Driven by the Data

Analogy: Discovering allergies

Reinforcement Learning

Algorithm learns in a reward based system to determine a series of actions.

Driven by the Reward

Analogy: Dog training

Jet representations

Jets as images

Input: jet image

JHEP 2021, 206 (2021)

Jets as a collection of objects

Input: declustering history, order of constituent p_T

Jets as a single object

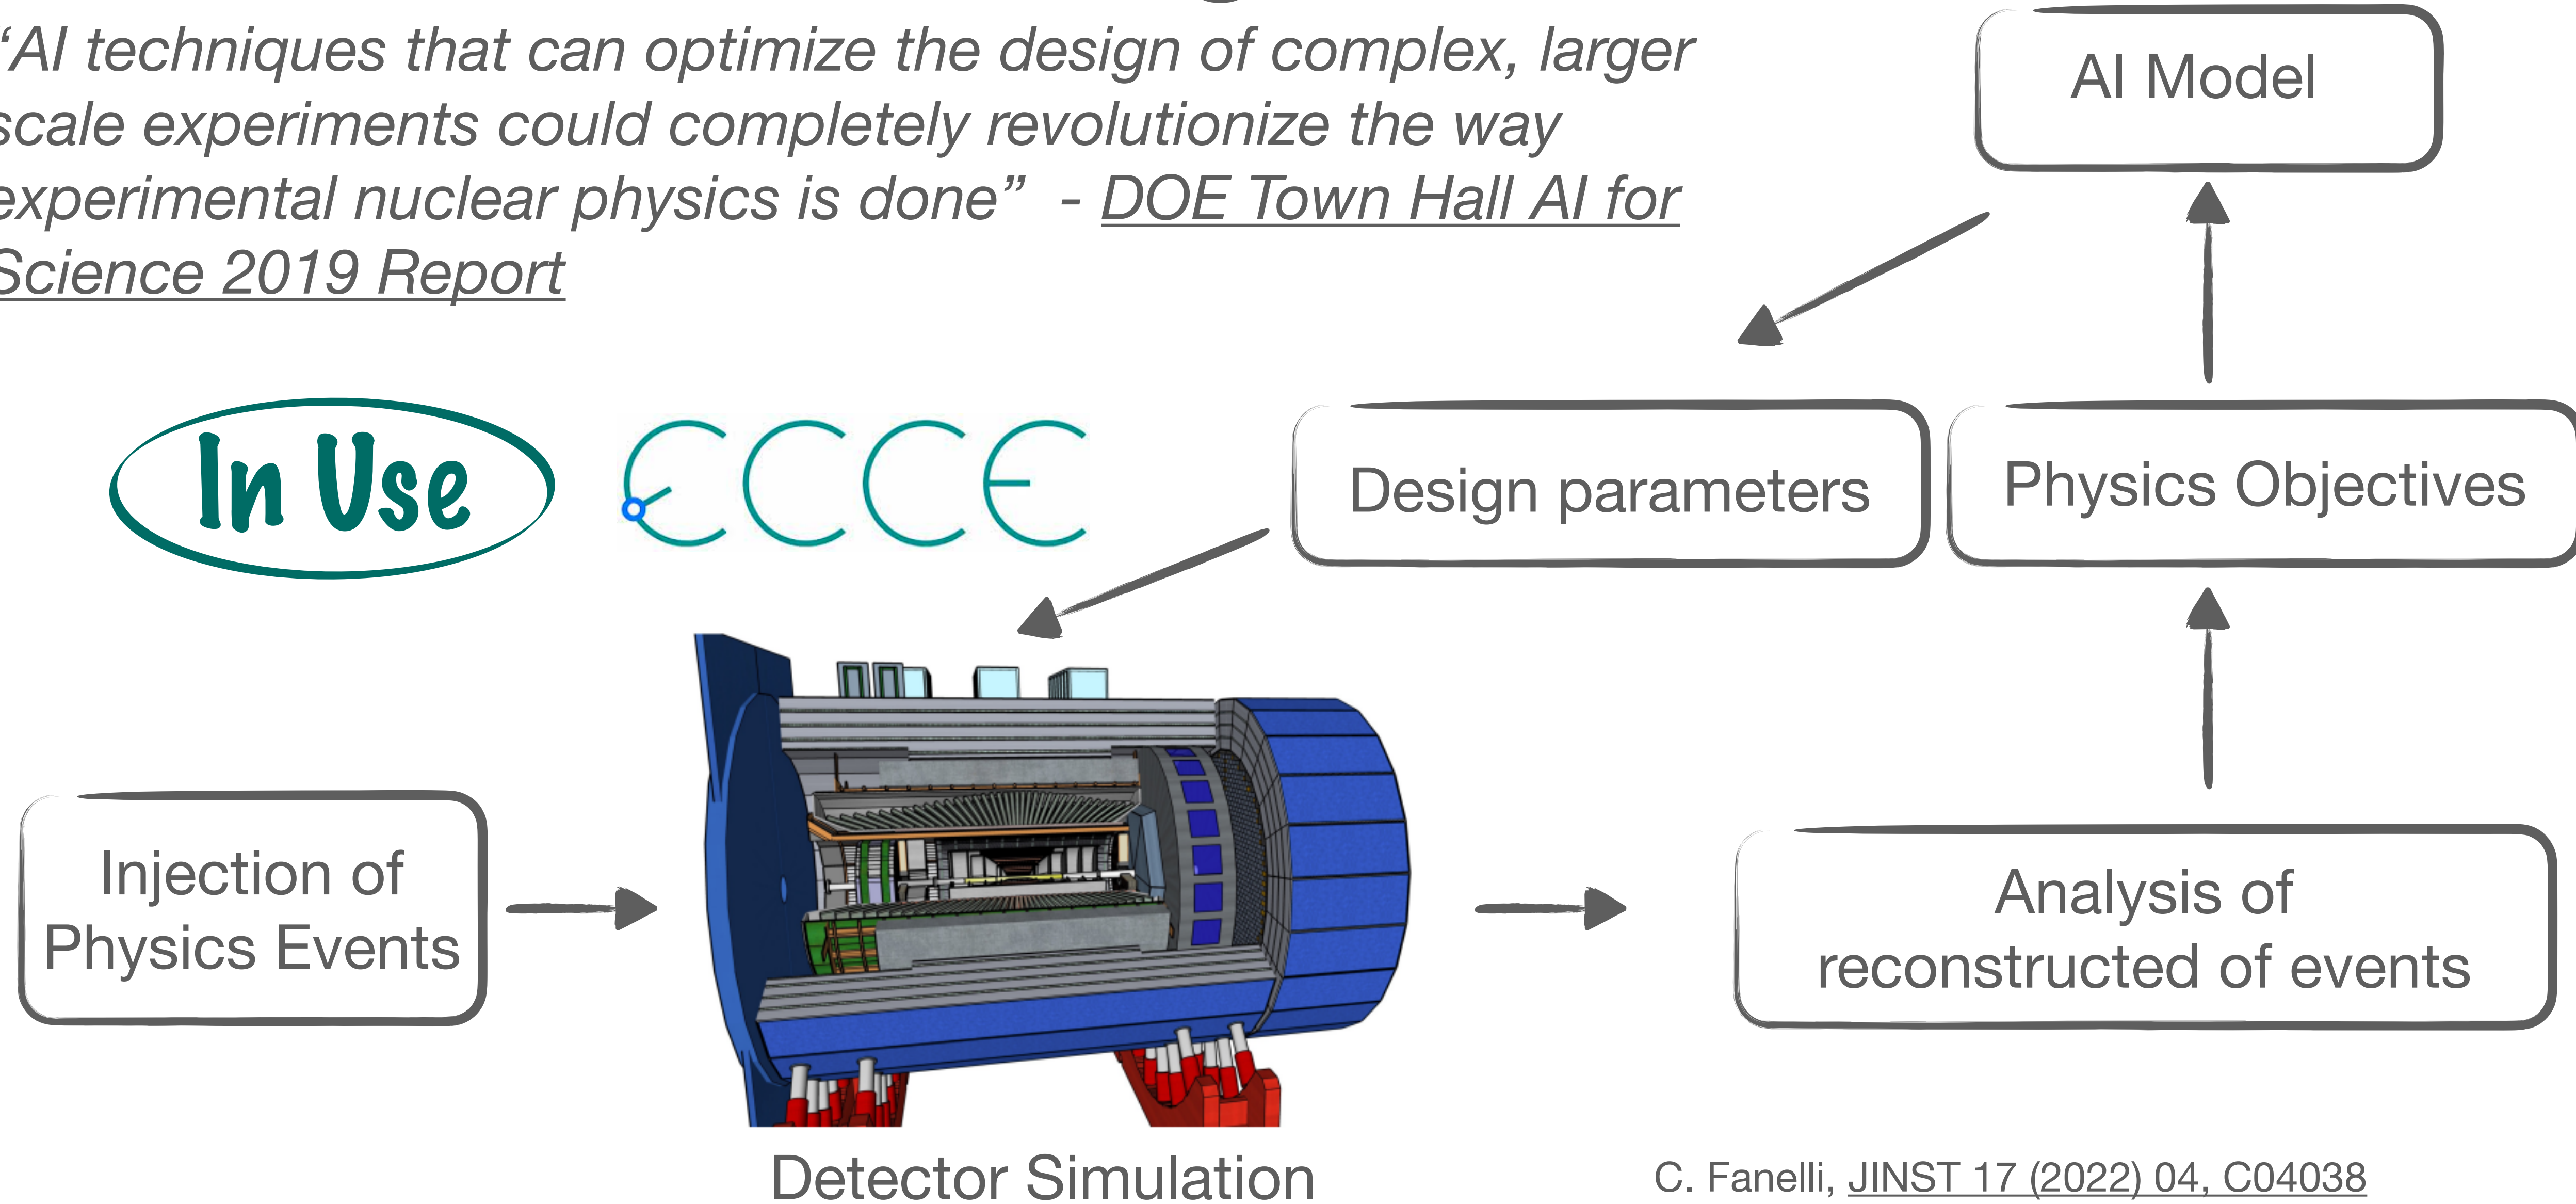

Input: jet mass, radial moments, other jet properties...

Different representations suitable for different problems → also different ML algorithms!

AI for detector design

“AI techniques that can optimize the design of complex, larger scale experiments could completely revolutionize the way experimental nuclear physics is done” - DOE Town Hall AI for Science 2019 Report

C. Fanelli, JINST 17 (2022) 04, C04038

Quark vs. gluon jet tagging

→ Longstanding effort (since 1991)!

ATL-PHYS-PUB-2017-017

[arXiv:2204.00641](https://arxiv.org/abs/2204.00641)

Quark Jets

Gluon Jets

- Difficult to do (even in pp)
- Large overlap between samples

ATLAS uses CNNs, improvement over traditional techniques in pp

Quark vs. gluon jet tagging in HIs

Y.Chien, R.Elayavalli, arXiv:1803.03589

→ Early indications in JEWEL simulations that this will be much more difficult in HI collisions!

In HIs - this is an ongoing effort!

Signal/background discrimination

ALICE

Select HF hadron w/ ML Ex: $\Lambda_c^+ \rightarrow pK_s^0$

Phys.Lett.B 839 (2023) 137796

◆ BDT
implemented
in XGBoost
using
hipe4ML

PRL 119 (2017) 152301

Cut optimization for open beauty
done with ROOT TMVA.

Uses of ML for High Energy Physics

The LHC Olympics 2020

A Community Challenge for Anomaly
Detection in High Energy Physics

Many broad categories of applications!

Triggering Systematic Uncertainty Reduction
Anomaly Detection Object Classification
Data Quality Assessment Detector Simulation
New Physics Searches

Anomaly detection (LHC Olympics, [arXiv:2101.08320](https://arxiv.org/abs/2101.08320))

Object Classification [arXiv: 1712.07158](https://arxiv.org/abs/1712.07158)

*What about heavy-ion
physics specifically?*

Detector Simulation

(CaloGAN, [PRL 120, 042003 \(2018\)](https://arxiv.org/abs/1804.04203))

The conventional approach

→ Typically (in ALICE) perform a pedestal subtraction of the background.

$$p_{T,\text{rec}} = p_{T,\text{raw}} - \rho A_{\text{jet}}$$

→ Corrects for the background in the average case, but neglects residual fluctuations.

→ A cut on the leading track of the jet is commonly also applied to remove fake jets, but biases the jet population.

ML and jet signals

➡ ML allows for a multi-variate treatment of signal and background discrimination.

➡ Generalized and optimized version of the conventional approach!

ML background estimator

ML approach: Use ML to construct the mapping between measured and corrected jet without a leading track bias.

Aim: To extend measurements to regions where the background has a large impact (lower p_T and large R).

Process

Training (PYTHIA fragmentation)

Train on “hybrid event” created by embedding PYTHIA jets into Pb-Pb Background

Key is that this background is *realistic*.

Testing

Apply ML estimator to hybrid events not used in training.

Do we get back the signal we put in?

Shallow neural network

We intentionally utilize “simple” ML techniques! This leads to greater interpretability!

Features for training

Ask ourselves two questions

How important is the feature to the model? → Feature Scores

Higher the feature score, more often variable is used in training.

How correlated is the feature with other features?

Feature Score = Mean Decreased Impurity

Feature	Score	Feature	Score
Jet p_T (no corr.)	0.1355	$p_{T, \text{const}}^1$	0.0012
Jet mass	0.0007	$p_{T, \text{const}}^2$	0.0039
Jet Area	0.0005	$p_{T, \text{const}}^3$	0.0015
Jet p_T (area based corr.)	0.7876	$p_{T, \text{const}}^4$	0.0011
LeSub	0.0004	$p_{T, \text{const}}^5$	0.0009
Radial moment	0.0005	$p_{T, \text{const}}^6$	0.0009
Momentum dispersion	0.0007	$p_{T, \text{const}}^7$	0.0008
Number of constituents	0.0008	$p_{T, \text{const}}^8$	0.0007
Mean of constituent p_T s	0.0585	$p_{T, \text{const}}^9$	0.0006
Median of Constituent p_T s	0.0023	$p_{T, \text{const}}^{10}$	0.0007

Iteratively remove unimportant or highly correlated features!

R.Haake, C. Loizides Phys. Rev. C 99, 064904 (2019)

Evaluating the performance

$$\delta p_T = p_{T,\text{rec}} - p_{T,\text{true}}$$

$p_{T,\text{rec}}$ = prediction from ML for target

$p_{T,\text{true}}$ = *target* (matched PYTHIA detector level jet)

Narrow $\delta p_T \rightarrow$ Reduced residual fluctuations

Are we getting back to the *target*? Is the ML working?

Evaluating the performance

Residual fluctuations significantly reduced!

$$\delta p_T = p_{T,rec} - p_{T,true}$$

Fragmentation bias

Learning on constituents introduces a fragmentation bias because our training sample is PYTHIA.

Vacuum jet

Jet in Medium

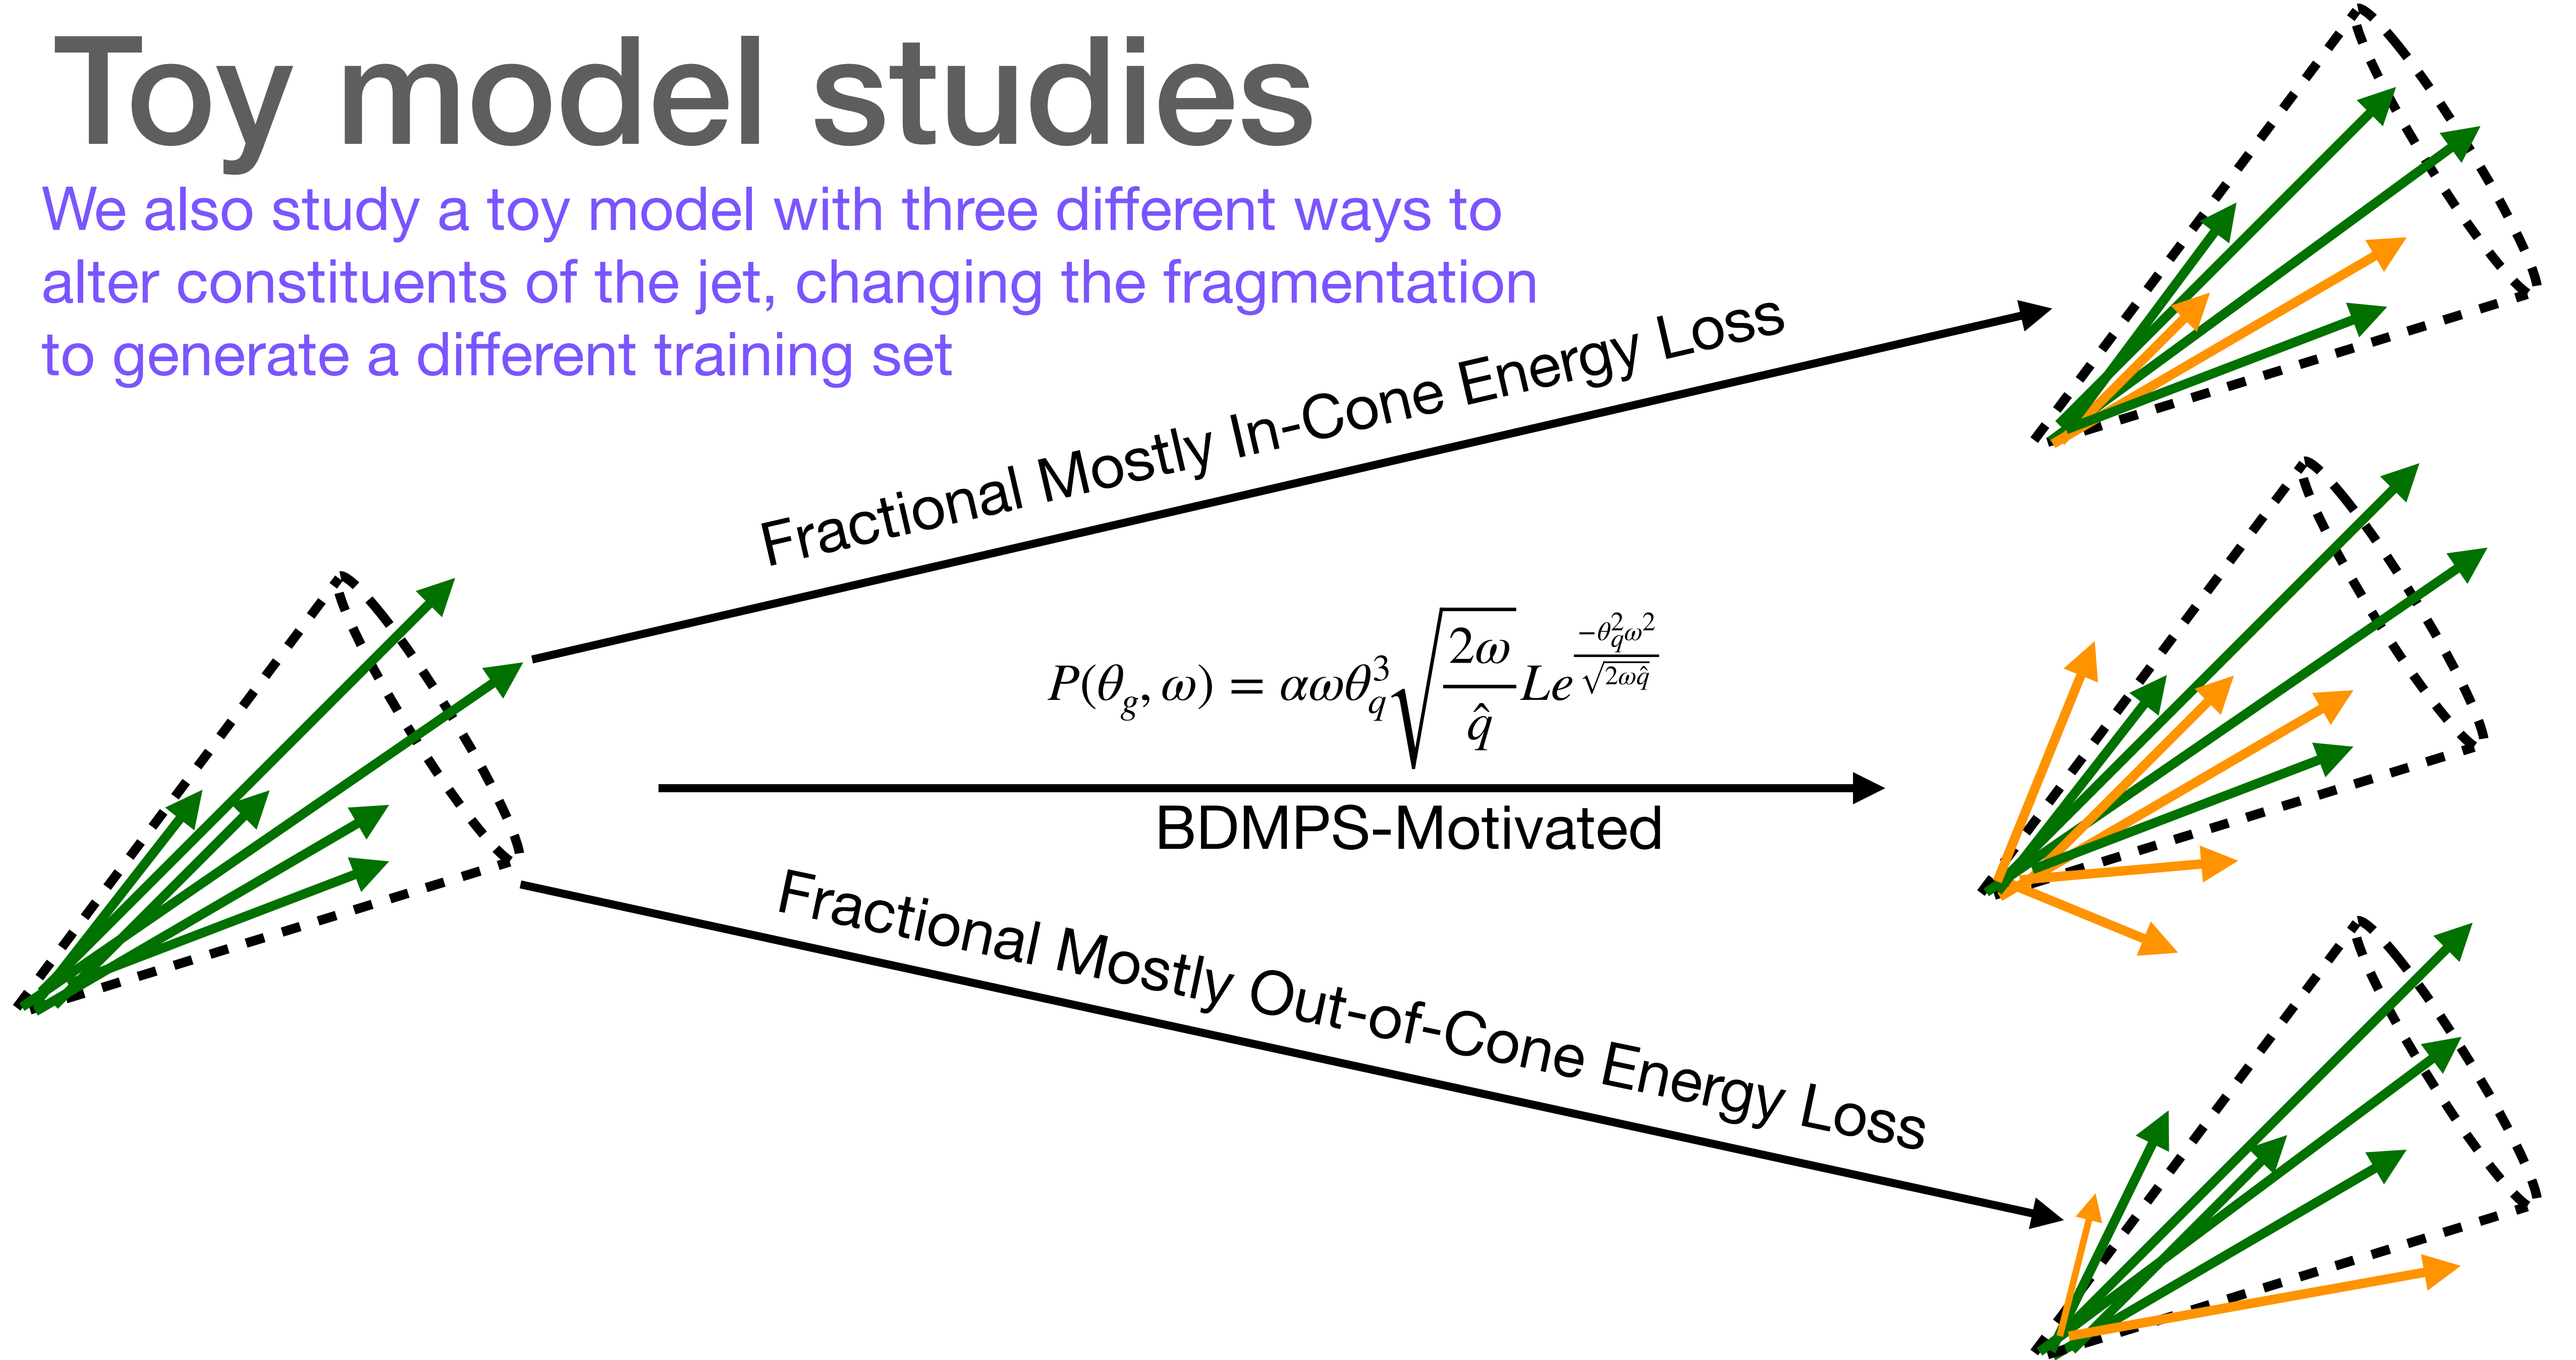

We know that fragmentation in heavy-ion collisions is modified by the presence of the medium.

We want to investigate how this impacts the final result we get with ML!

Phys. Rev. C 98, 024908 (2018)

Toy model studies

We also study a toy model with three different ways to alter constituents of the jet, changing the fragmentation to generate a different training set

Modification to the fragmentation function

Leading 8 particles

Inclusive particles

Toy model modifications indeed modify the fragmentation, some modifications are more extreme than others.

8 leading particles are what we chose to train on.

Quark vs. Gluon Jets with ML

How to tell quark jets from gluon jets

Jon Pumplin

Department of Physics and Astronomy, Michigan State University, East Lansing, Michigan 48824
(Received 22 May 1991)

Long-standing effort starting around 1991!

Quark and gluon jets have different color factors and substructure!

→ We will focus on an effort in HL collisions!

Y. Chien, R. Elayavalli: 1803.3589

Quark Jets

Gluon Jets

$$C_f = 4/3$$

$$C_A = 3$$

→ Use jet images with **deep CNNs (DCNNs)** to discriminate q/g.

→ Train using jet images in JEWEL!
(**Supervised Learning**)

Quark vs. Gluon Jets with ML

Y. Chien, R. Elayavalli: 1803.3589

→ Lower the curve, the better the performance.

→ All methods explored tend to perform consistently, indicating that they may be picking up on similar features.

→ The performance worsens for Pb—Pb, due to the large UE.

Quark and gluon discrimination is a difficult and ongoing effort in HIs!

Future: Apply these methods to data in pp and Pb—Pb!

Deep Learning Jet Modifications

Use **supervised learning** on jet images **with a CNN** to perform the regression task of predicting the energy loss ratio in HI collisions (hybrid model).

Y. Du, D. Pablos, K. Tywoniuk: 2101.07797

quenched

unquenched

$$\chi_{jh} = \frac{E_f^h}{E_i^h}$$

Shows good performance!

Very useful to separate and study **quenched** vs. **unquenched** jets as well as extracting the initial energy of the jet.

Future: Apply these methods to different models & variables, improve performance.

Far future: Apply these methods to data!

Summary and Conclusions

Machine learning is a great tool for both understanding heavy-ion physics and making measurements, especially with jets! (Jets are also a great playground for ML!)

Despite many great developments, still ongoing challenges → especially for applying ML to data!

Coming years are an exciting time for ML + heavy-ions → lots of uncharted phase space and opportunities to get involved!

ML is everywhere!

ML automated Go player

Voice assistants

NETFLIX

Recommendation Software

TECHNOLOGY
Autonomously driving cars

➔ **ML is a fundamental part of countless technologies we use every day!**

➔ Where does HEP fit in here?

ML Addressing Flow

arXiv: 1810.06324

- ➔ The area based method does not account for the fact that the background fluctuates.
- ➔ When we add in a v_2 , we see that the ML still performs well! → Is still correcting for this flow!

- ➔ When applying to data, the ML performs similarly across all event planes
→ ML is performing a flow correction.
- ➔ This is important especially for larger R jets.

ML for Observable Design

Could we use ML to construct a maximally discriminative observable to characterize a jet signal?

➔ Step 1: Set up a binary classification between PbPb and pp jets.

Y. Lai, J. Mulligan, M. Ploskon, F. Ringer: 2111.14589

ML for Observable Design

Could we use ML to construct a maximally discriminative observable?

→ Step 2: Once we have the classifier, create an observable which approximates the classifier.

Benefits

- No model dependence.
- Observable will be theoretically calculable.

Challenges

- Variation in detector response across data taking period.
- Observable can be difficult to interpret, complex.

Y. Lai, J. Mulligan, M. Ploskon, F. Ringer: 2111.14589

Intro to Random Forest

Random forests are composed of decision trees.

Decision trees are a set of rules organized in a tree structure.

Each node is a rule which subdivides the dataset into two or more parts (think 20 questions).

Output of the random forest is a combination of the output of each of the decision trees.

In training, the algorithm sets up the rules of each decision tree.

Neural Networks

Flow of information happens between **nodes**.

A weight is associated with each input to a given node.

The output of each node is a function of the weighted inputs. The output of a node j , is generally written something like

$$O_j = \sum_{i=0}^{N-1} w_{ij} O_i$$

In training we seek to learn the set of weights which minimize the total error of the network.

Convolutional Neural Networks (CNNs)

→ Key component of a CNN is the **convolution layer**, which (with the help of a filter) will determine if a feature/pattern is present.

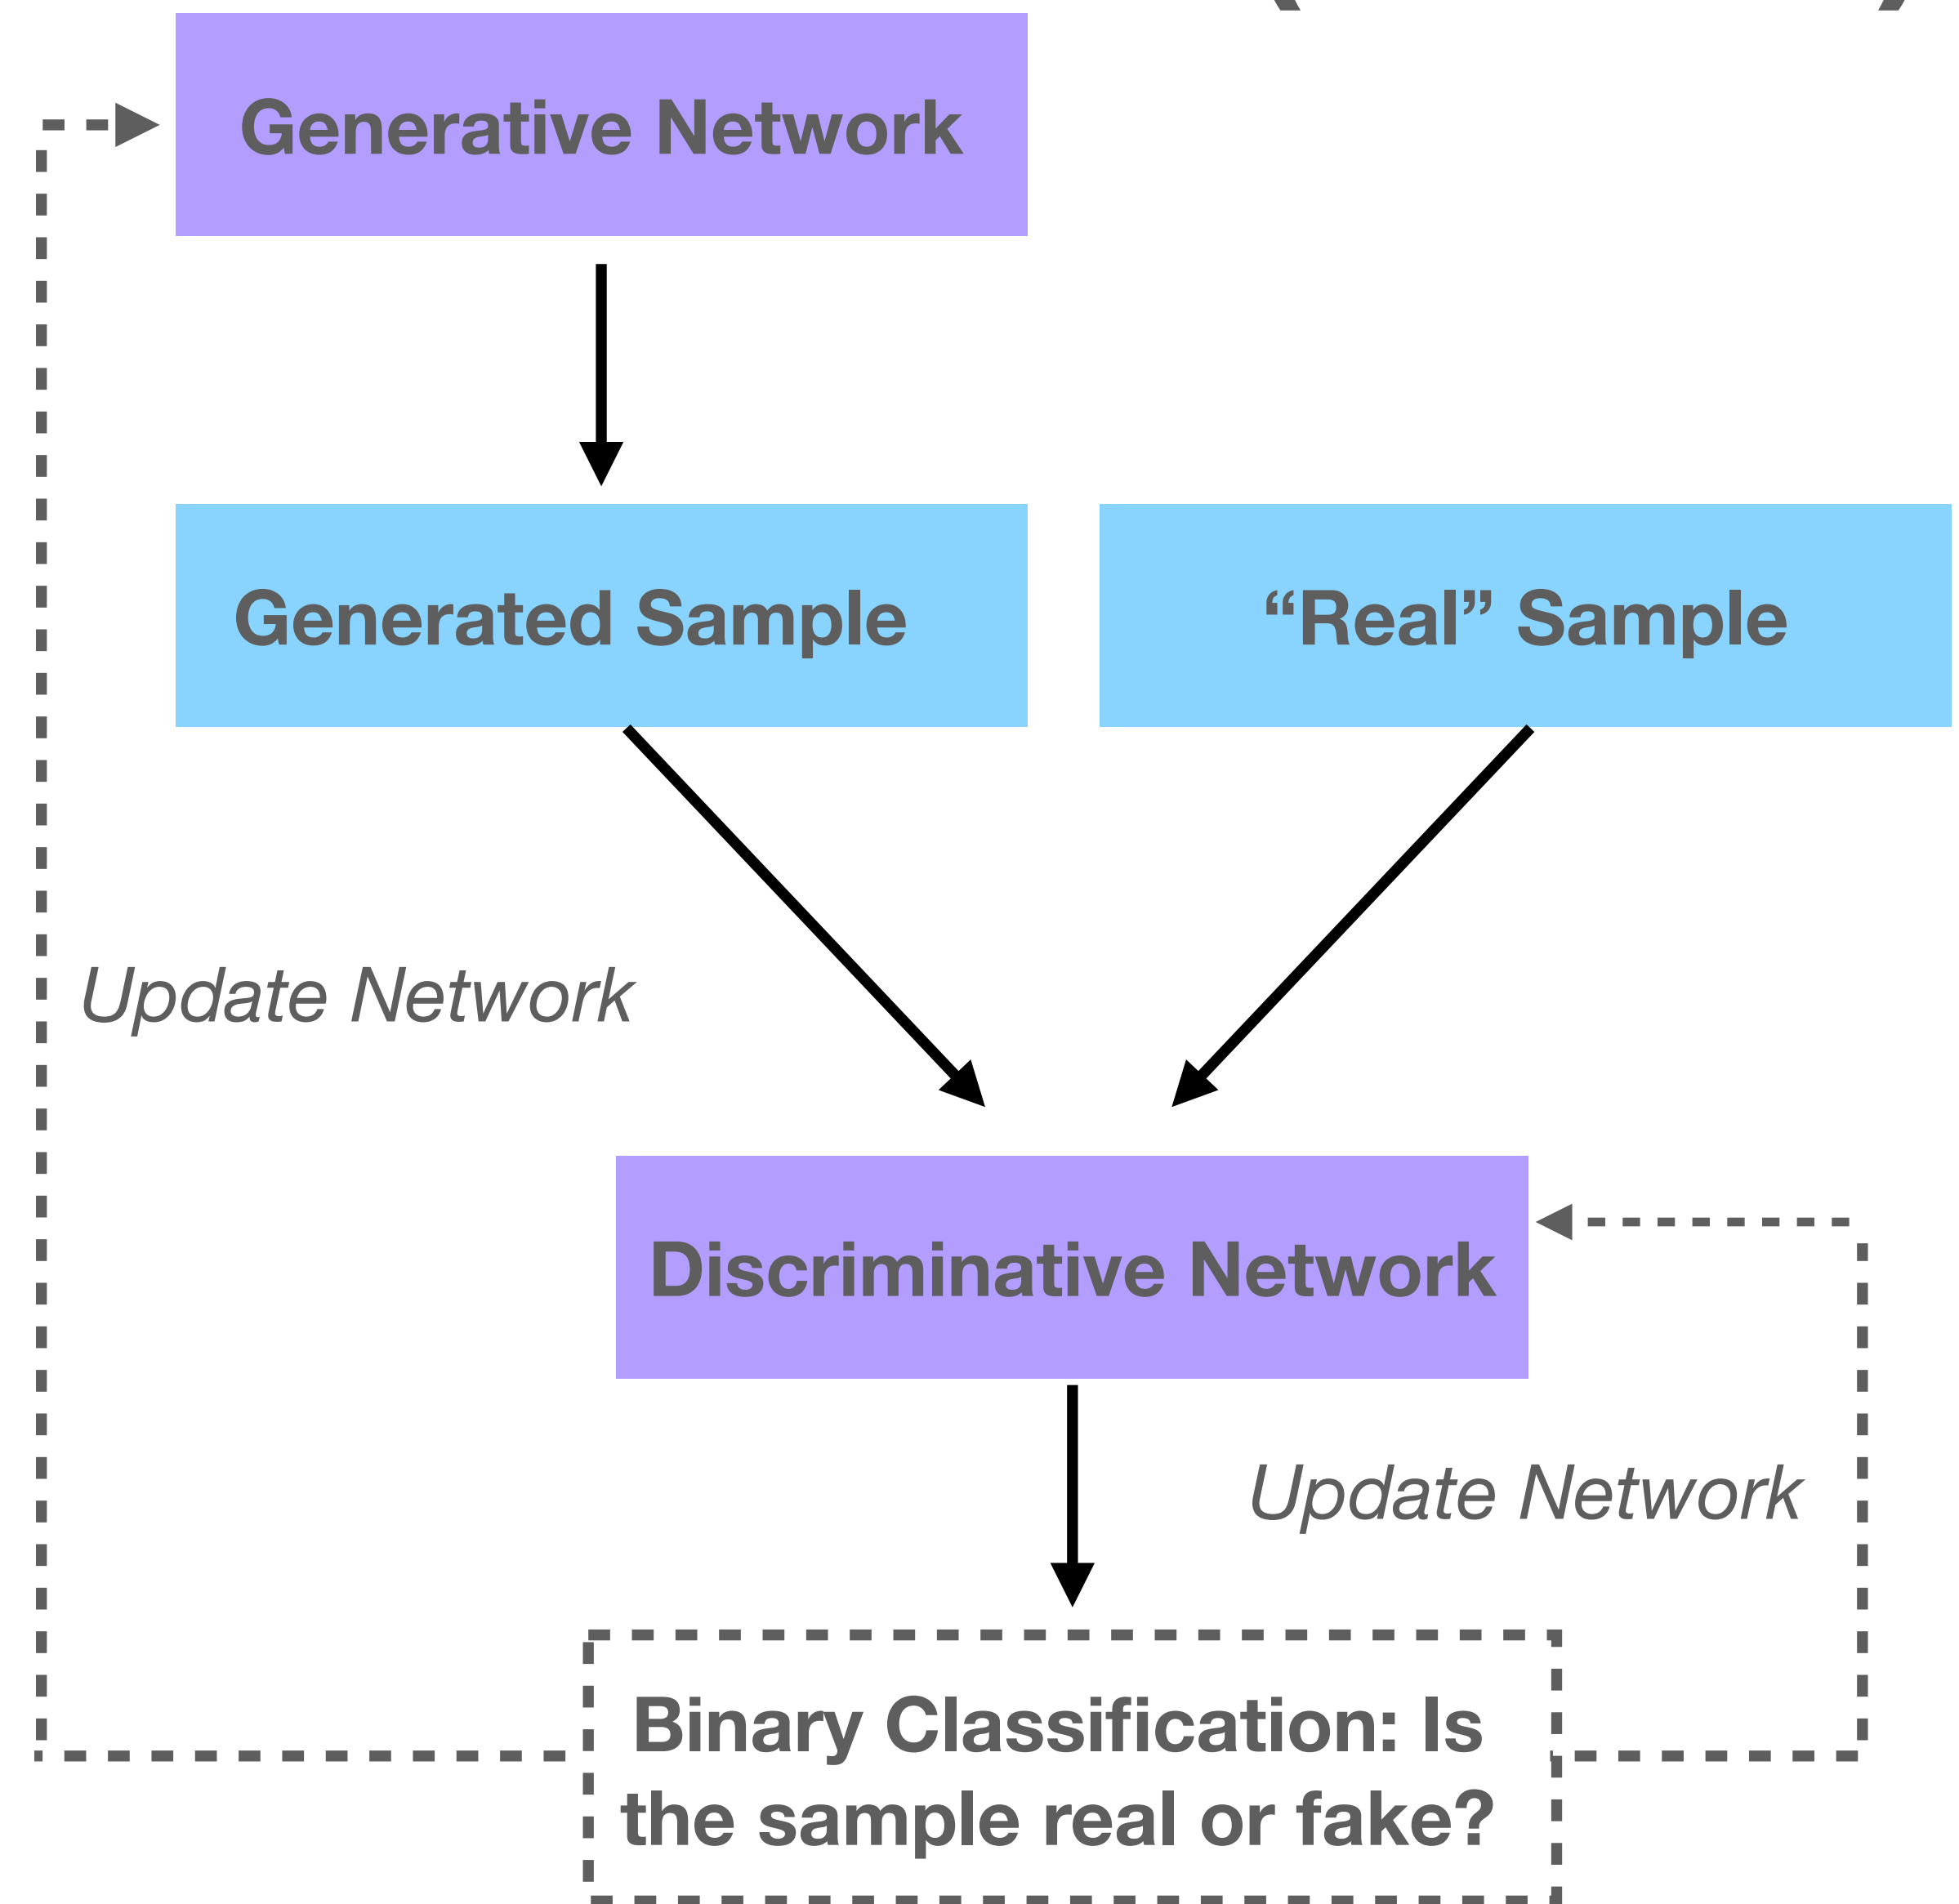

Generative Adversarial Networks (GANs)

Two networks compete with one another in a game.

The generative network seeks to fool the discriminative network.

The discriminative network seeks to find the real sample from the generated samples.

Indirect training → generative network never sees the true distribution!

Intro to Linear Regression

Linear regression predicts the value of a **dependent variable** based on a given **independent variable** (feature x_1 with a given weight w_1).

$$y = b + w_1 x_1$$

The example at the right is a simplified view in reality we have multiple features each having a separate weight.

$$y = b + w_1 x_1 + w_2 x_2 + w_3 x_3 \dots$$

Training determines the optimal weight for each feature.

Different algorithms for different problems!

(Shallow or Deep) Neural Networks → *Great for making predictions!*

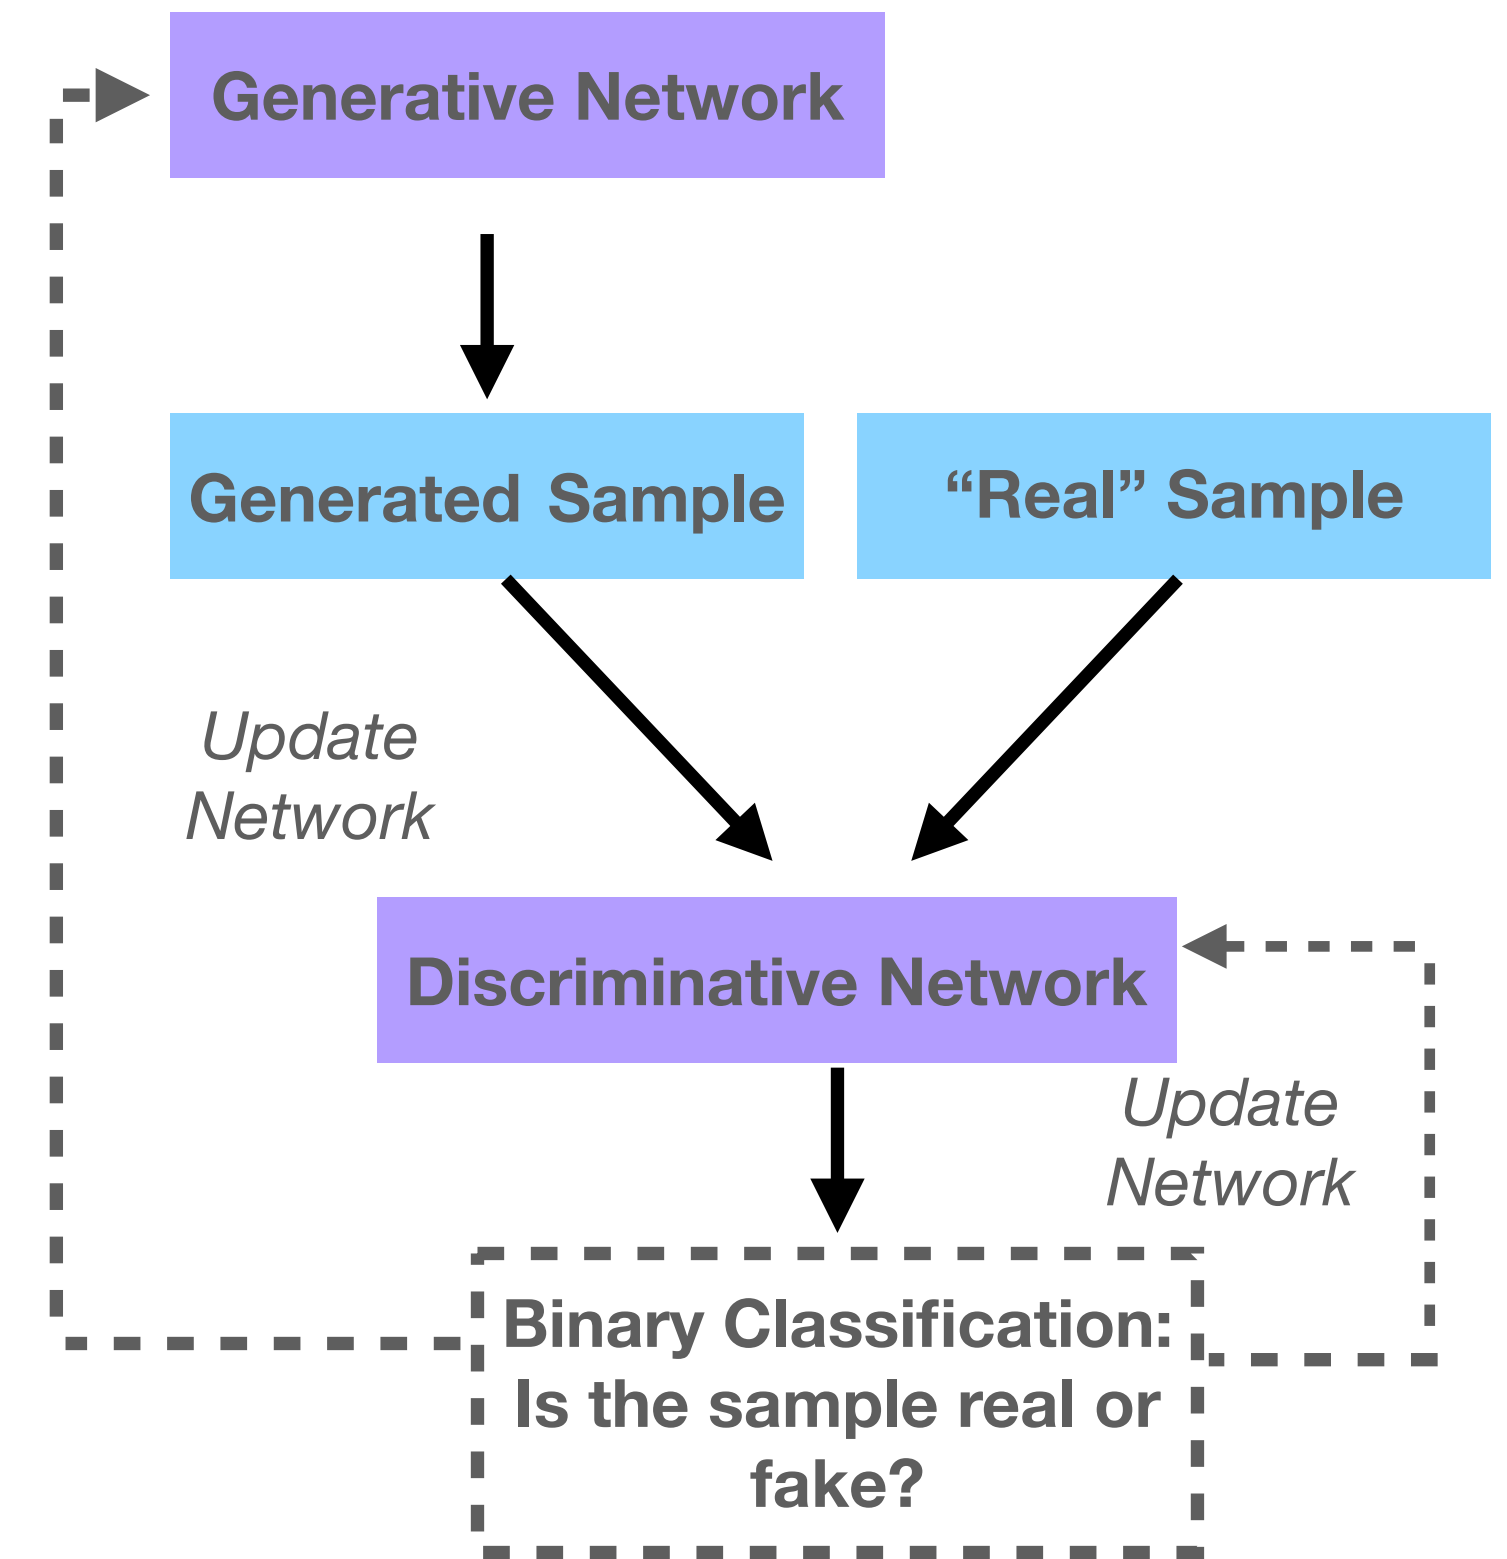

Random Forest (Decision Trees)

Convolutional Neural Networks (CNNs) → *Great for image processing!*

Linear Regression

Generative Adversarial Networks (GANs) → *Powerful tool for generating samples!*

Technical Details of the ML

Regression task where the regression target is the detector level jet p_T .

Here we are prioritizing a simple model!

Training sample 10%, testing sample 90%.

Implemented in *scikit-learn*. Default parameters used unless otherwise specified.

Shallow Neural Network

Shallow, 3 layers with
[100, 100, 50] nodes

ADAM optimizer, stochastic
gradient descent algorithm.

Nodes/neurons activated by a
ReLU activation function.

Linear Regression

Normalization set to
true by default.

Random Forest

Ensemble of 30 decision trees.

Maximum number of
features set to 15.

Deep Learning Jet Modifications

arXiv:2101.07797

Ex: Groomed jet radius

Small R_g (Collimated)

Large R_g (wide)

Unquenched jets != jets in vacuum
→ selection bias!

Jets that fall into the “unquenched class” tend to be narrower than average jet population in vacuum.

ML is a cool tool to begin to think about selection biases and its impact on how we see quenching!

Future: Apply these methods to different models & variables, improve performance.
