Contribution ID: 44

Type: Recorded Presentation

TPC Development by the LCTPC Collaboration for the ILD Detector at ILC

A large, worldwide community of physicists is working to realise an exceptional physics program of energyfrontier, electron-positron collisions with the International Linear Collider (ILC). The International Large Detector (ILD) is one of the proposed detector concepts at the ILC. The ILD tracking system consists of a Si vertex detector, forward tracking disks and a large volume Time Projection Chamber (TPC) embedded in a 3.5 T solenoidal field. The TPC is designed to provide 220 three dimensional points for continuous tracking with a single-hit resolution better than 100 μ m in r ϕ , and about 1 mm in z. An extensive research and development program for a TPC has been carried out within the framework of the LCTPC collaboration. Three MPGD concepts are being developed for the TPC: Gas Electron Multiplier, Micromegas and GridPix. Successful test beam campaigns with different technologies have been carried out. Fundamental parameters such as transverse and longitudinal spatial resolution and drift velocity have been measured. In parallel, a new gating device based on large-aperture GEMs have been produced and studied in the laboratory. In this talk, we will review the track reconstruction performance results and summarize the next steps towards the TPC construction for the ILD detector.

Primary experiment

Authors: TITOV, Maksym (Université Paris-Saclay (FR)); KAMINSKI, Jochen (University of Bonn (DE)) Presenter: KAMINSKI, Jochen (University of Bonn (DE))

Track Classification: Gaseous Detectors
