

LHC EFT WG

Third area 1 meeting

Gauthier Durieux
(CERN)

with Ilaria Brivio, Sally Dawson, Jorge de Blas, Pietro Govoni, Pierre Savard
on behalf of WG conveners

2020-10-20: [First general meeting](#)

2020-12-07: [First area 1 meeting](#)

2021-01-19: [Second area 1 meeting](#)

2021-05-03: [Second general meeting](#)

Area 1. EFT formalism

a. Bases, notations, inputs***

common conventions, translations, common EW inputs

preliminary note
here

b. Assumptions***

flavour structures, classes of BSM, symmetries

c. Truncation, uncertainties, validity**

~~linear/quadratic, double ins., dim-8, trunc. errors, etc.~~

preliminary note
here

d. Theory constraints**

unitarity, positivity, incorporation in fits

Meeting plan

1. Quick refresher on the notes

2. Feedback from ATLAS & CMS

3. Written comments and discussion points

4. Discussion

Area 1, EFT formalism

Monday 28 Jun 2021, 14:00 – 18:00 Europe/Dutch

Gauthier Durieux (CERN), Itilia Brito (University of Heidelberg), Jorge de Blas (Universidad de Granada (U), Pierre Savard (University of Toronto (U)), Pietro Govoni (Università & INFN, Milano Bicocca (I)), Sally Dawson

Description The two notes presented at the 2nd general meeting ([here](#)) will be discussed, with feedback from experimental collaborations and working-group participants.

Please log in ▾

Convenor hci-eftwg.admin@cern.ch

14:00 – 14:15 Introduction

15m

14:20 – 14:40 Feedback from ATLAS

20m

Speaker: Harness Miller (University of Sheffield (S))

14:45 – 15:10 Feedback from CMS

20m

Speaker: Alexander Josef Grohgrain (Deutsches Elektronen-Synchrotron (DE))

15:20 – 15:30 Summary of points for discussion

10m

15:35 – 16:35 Discussion

1h

Electroweak input parameters

Options for EFT at the LHC

with contributions from: A. Denner,
A. Freitas, C. Hays, B. Pecjak, A. Vicini

Include non-inputs as constraints!

$$\{\alpha, G_\mu, m_Z\}$$

$$\{G_\mu, m_Z, m_W\}$$

$$\{\alpha, m_Z, m_W\}$$

+used for EWPO
in the past+

+used in tools+

-less used-

+most precise inputs+

- m_W measurements actively pursued-

-EFT dependent W pole-

+clear model-independent meaning
of mass thresholds+

-leptonic operator contaminations-

-slightly slower
EW convergence-

Options for EFT at the LHC

with contributions from: A. Denner,
A. Freitas, C. Hays, B. Pecjak, A. Vicini

Include non-inputs as constraints!

$\{\alpha, G_\mu, m_Z\}$

+used for EWPO
in the past+

+most precise inputs+

-EFT dependent W

$\{G_\mu, m_Z, m_W\}$

+used in tools+

$\{\alpha, m_Z, m_W\}$

-less used-

tentative recommendation

others for comparison

re-evaluation with more NLO EW

-leptonic operator contaminations-

actively pursued-

dent meaning
olds+

-slightly slower
EW convergence-

Truncation, uncertainties, validity

Common ground

1. dim-6 truncation in the near future
EFT validity = dim-6 matches full model
2. well-defined squares of single dim-6 insertions “ $(\text{dim-6})^2$ ”
translatable exactly between dim-6 bases
3. required UV assumptions to compare dim-6 and -8 magnitudes
UV-dependent EFT validity (e.g. using a *power counting*)

Theory proposals A & B

based on [HXSWG '16], [LHC TOP WG '18]

A: [proposal](#), [video](#), [slides](#), Contino, Falkowski, Goertz,
Grojean, Maltoni, Panico, Riva, Wulzer
B: [proposal](#), [video](#), Degrande, Maltoni,
Mimasu, Vryonidou, Zhang

1. multi-dimensional likelihoods in EFT space
 - interpretability required for validity

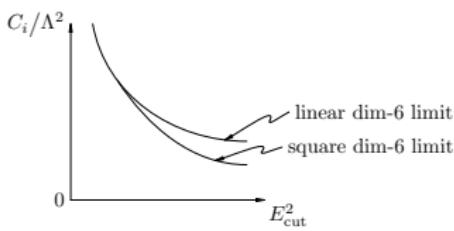

2. quadratic [default] vs. linear comparison
 - qualitative validity: *broad* or *restricted*

3. control over probed scale

(e.g. sliding upper cut= $E_{\text{cut}}=M_{\text{cut}}$ =clipping,
double differential, etc.)

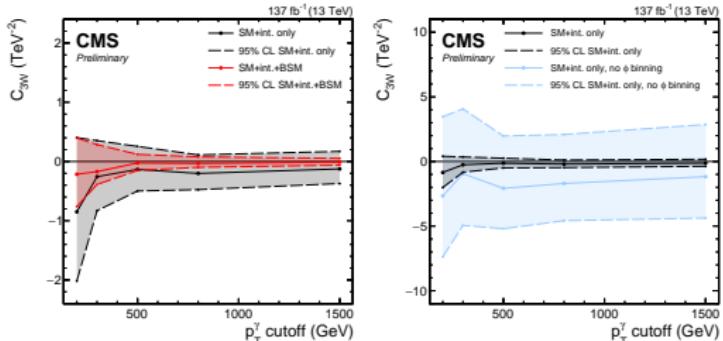

- re-design analyses, also for sensitivity
- global combinations?

4. interpretation & validity *a posteriori*
 - retain UV independence till then
 - quantifying dim-8?

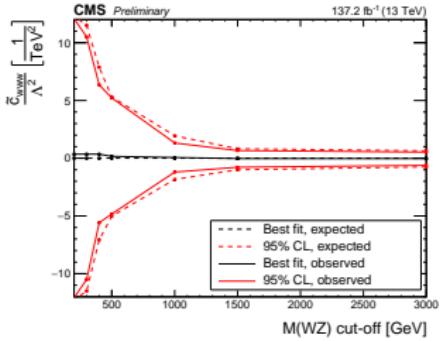

Clipping implementation examples

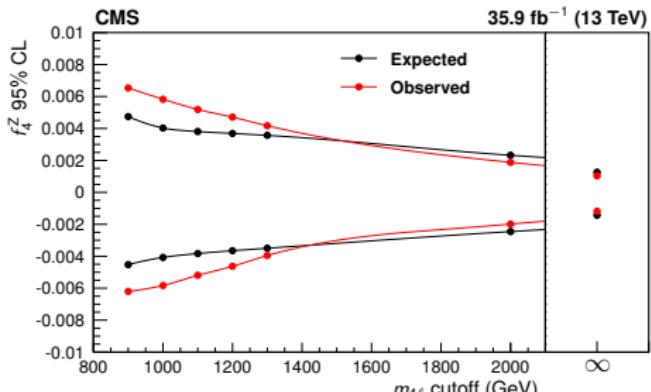

$W\gamma$ [CMS-SMP-20-005]

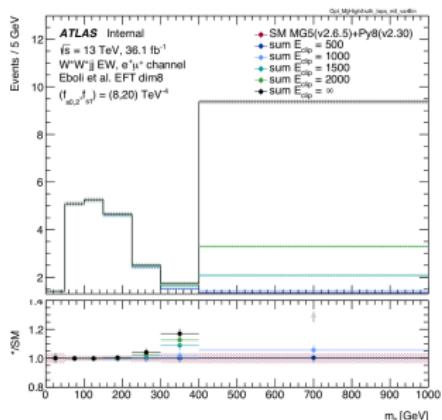

WZ [CMS-SMP-20-014]

ZZ [CMS-SMP-16-017]

same-sign WW [ATLAS]

Theory proposal C

1. $(\text{dim-6})^2$ as proxies for dim-8 interferences
2. many models encompassed in one power counting rule
→ models to be covered?
3. signal: linear dim-6
unc.: known $(\text{dim-6})^2 + \text{dim-8 estimates}$
4. unc. fed into EXP analyses
→ folding-in UV assumption for dim-8 estimate
5. unc. = $\pm(\text{dim-6})^2 \times (1 + \sqrt{N_8} \frac{g_{\text{SM}}^2}{\mathfrak{C}_6 \Lambda^2} \sqrt{1 + \frac{1}{\mathfrak{C}_6^2 \Lambda^4}})$
→ models covered?

Meeting plan

1. Quick refresher on the notes

2. Feedback from ATLAS & CMS

3. Written comments and discussion points

4. Discussion
