ATLAS Data Access Policy

Approved by CB on September 23, 2014  
Revision approved by CB on February 12, 2021

**Introduction**

ATLAS has fully supported the document outlines the policy described in the DPHEP [1] in a usable way to people external to the collaboration.

In 2020, an LHC Open Data Working Group was formed by the ATLAS experiments to align the approaches to open access with the conclusions of the ODWG in its implementation document released by the CB in October 2020. They are described here.

The ATLAS policy for data preservation and collaboration's need to preserve them open access. To support this, ATLAS will develop and support the tools necessary to do so.

**Policies for Different Access Levels**

Open access to ATLAS data by levels of increasing complexity (from publication to raw data) and the necessary analysis tools allowing to produce the ATLAS detector.

The sharing of data with non-ATLAS members (e.g. technicalities or new data for analysis) approved by the ATLAS Executive Committee should not be shared beyond the collaboration.

**Level-1. Published results**

All scientific output is published in the ATLAS Conference Notes. All are open access beyond copyright law and the ATLAS detector.

Data associated with journal publications (e.g. cross section values, likelihoods) are stored in appropriate repositories. Additional material related to the analysis is often provided for the ATLAS detector.

Information on signal acceptances is also made available to allow reinterpretation of these searches in the context of models developed by theorists after the publication. ATLAS is also exploring how to provide the capability for reinterpretation of searches in the future via a service such as RECAST [6]. RECAST allows theorists to evaluate the sensitivity of a published analysis to a new model they have developed by submitting their model to ATLAS.

**Level-2. Simplified data for outreach & education, and collaboration with non-HEP sciences**

**Outreach and education**

ATLAS recognizes the vital role of outreach and education in the context of high energy physics. Typically, a fraction of the ATLAS rich sample of events with interesting physics is made public for educational purposes. This includes event displays of selected events, simulated events, and collision data or simulated data. ATLAS collision data or simulated data made such data public for a diverse audience. Examples of the full content also be provided for educational purposes.

The data are provided for educational purposes and may not be used for publication of scientific results.

**Collaboration with non-HEP sciences**

ATLAS encourages scientific collaboration with non-HEP sciences in computer science or education. The ATLAS data (simulated events or collision data) are used should proceed via the established channels. Upon completion of the scientific analysis and the tools required to use/access the data are not sensitive and after confirmation.

**Level-3. Reconstructed data**

ATLAS recognizes the potential value of reconstructed data available after reasonable embargo period by a release of appropriate simulated data. The ODWG documents [2,3] detail the LHC-ATLAS reconstruction process. By far the most practical means of condensed data is in partnership with the collaboration established association programme for members can submit a proposal, supported by the ATLAS detector, on a particular topic of interest. These proposals are reviewed by the ATLAS detector and the ATLAS detector.

**Level-4. Raw data**

ATLAS recognizes the potential value of raw data if granted give access to the ATLAS data and the internal information required for this analysis.

# Policy Documents: Access

Level 3: ATLAS participated in new CERN Open Data Working group under DRC to develop common LHC-wide policy on Level 3 Data

Two Documents:

**CERN Policy: begin to release data & software needed for robust analysis 5 years after close of a run**

**ATLAS Implementation (v. similar to CMS):**

- release 25% of data after 5 years
- release 50% of data after 10 years
- remainder at close of experiment
- max 20% of integ. lumi. as Open Data

The image shows two document thumbnails. The left one is titled 'CERN Open Data Policy for the LHC Experiments' and the right one is 'CERN Open Data Policy for LHC Experiments: Implementation Plan'. Both documents have vertical text on their left side that reads 'Not reviewed, for internal circulation only'. The right document also has a small '1' at the bottom right corner.

# Policy Documents: Access

**ATLAS Policy allows for special purpose datasets to be prepared & released for research policies: accompanied with publication as explanation**

**Both Bulk Level-3 data and Special Purpose datasets are/will be released on**

**CERN Open Data Portal**

- **crucial service for us for a long-term OD program**
- **first datasets under new policy released**
- **starting to preparer for bulk release in 2023**

The screenshot displays the ATLAS Open Data Portal interface. At the top, it features the ATLAS Experiment and CERN logos, along with the title 'ATLAS PUB Note' and the identifier 'ATL-PHYS-PUB-2021-002' dated '1st March 2021'. The main heading is 'Physics Object Localization with Point Cloud Segmentation Networks'. Below this, it identifies 'The ATLAS Collaboration' and the 'opendata CERN' logo. A search bar and navigation links for 'Help' and 'About' are visible. The dataset entry is titled 'Simulated low-level channel readout for Z->ee+jets decays in the ATLAS detector' and is attributed to 'ATLAS collaboration'. The citation information is provided: 'Cite as: ATLAS collaboration (2021). Simulated low-level channel readout for Z->ee+jets decays in the ATLAS detector. CERN Open Data Portal. DOI:10.7483/OPENDATA.ATLAS.53PM.J6PS'. Metadata tags include 'Dataset', 'Derived', 'Datascience', 'ATLAS', and 'CERN-LHC'. The 'Description' section states: 'This dataset includes simulated Z->ee+2jets and ZZ->4e events using the MadGraph event generator, showered with Pythia. A detailed description can be found in the PUB Note linked below. The dataset is composed of CSV files, one per event, where each row in the CSV file represents the relevant information to one hardware channel. See the table below for the column definitions and attached example Python code for reading a single file.' The 'Dataset characteristics' section reports: '119545 events. 2 files. 9.6 GB in total.'

# Policy Documents: Access

## Focus of ATLAS Level-3 approach:

- release format with best-known calibration (pre-processing): PHYSLITE
  - release software that allows full systematic analysis as Open Source
  - we release data & tools we use internally to enable best possible analysis
- responsibility of users: make use of the available resources**

The image shows two overlapping screenshots. The background is a GitHub repository page for 'athena' (Project ID: 53790). It displays statistics such as 80,372 Commits, 25 Branches, 1,462 Tags, 10.6 GB Files, 10.6 GB Storage, and 177 Releases. A merge notification for 'ATLASRECTS-6442\_debug' is visible. The foreground is a Zenodo record for 'Athena', dated April 9, 2019, with a 'Software' tag and 'Open Access' status. A yellow banner indicates a newer version is available. A red line connects the 'athena' repository to the Zenodo record.

# Likelihoods - the best Information we have

## Likelihood of the Measurement

The best, most precise, most reusable data product for existing data we produce at the LHC

- identified 20 years ago as key Open Science component
- encodes almost all details of the published result (systematics, correlations, ...)
- enables later re-use by combination (global fits)
- directly usable by researches at a high level (complements L3)

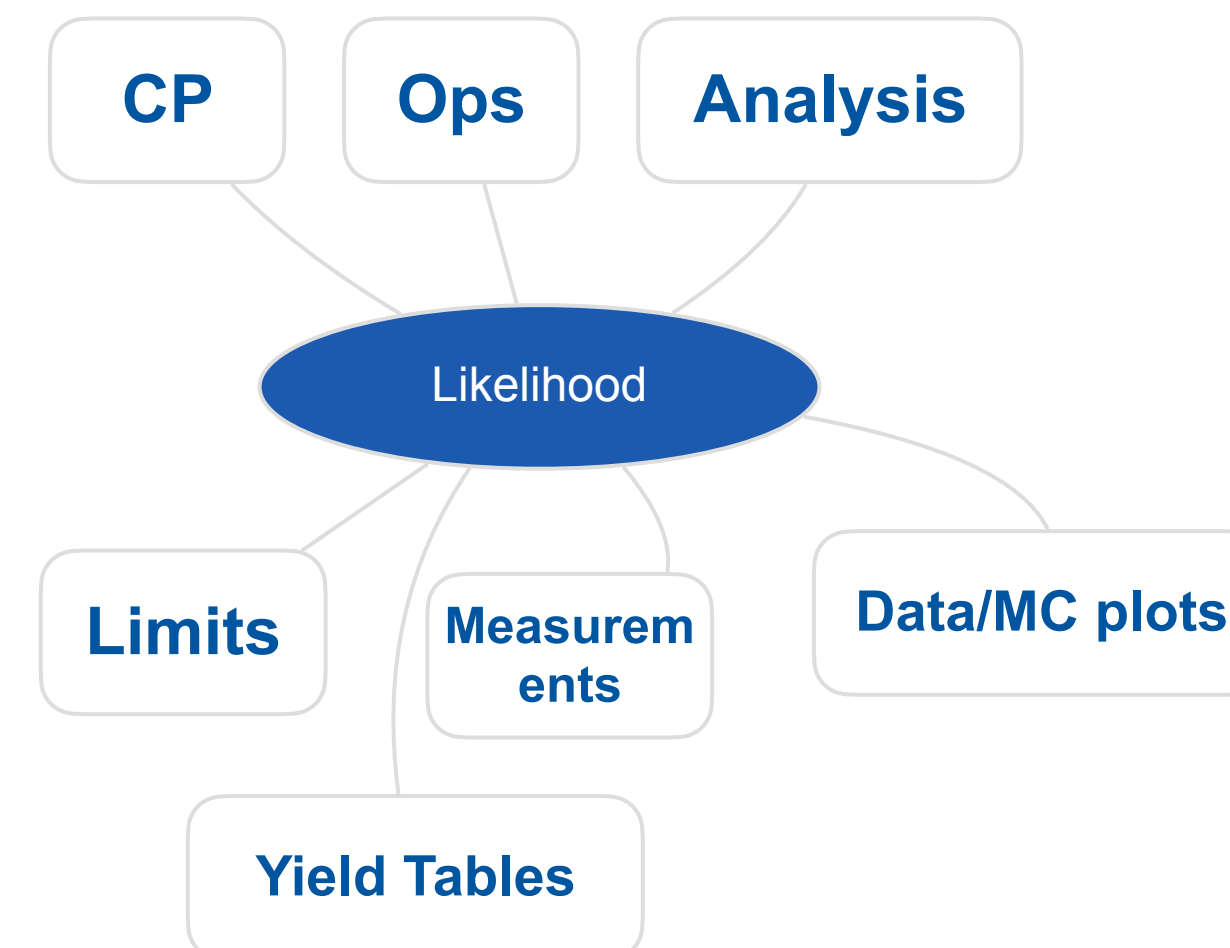

Massimo Corradi

It seems to me that there is a general consensus that what is really meaningful for an experiment is *likelihood*, and almost everybody would agree on the prescription that experiments should give their likelihood function for these kinds of results. Does everybody agree on this statement, to publish likelihoods?

Louis Lyons

Any disagreement? Carried unanimously. That's actually quite an achievement for this Workshop.

$$p(\text{theory} | \text{data}) = \frac{p(\text{data} | \text{theory})p(\text{theory})}{p(\text{data})}$$

# Likelihoods - the best Information we have

ATLAS releases likelihood as citable, reusable data items

The screenshot shows the HEPData website interface. On the left, there's a search bar and a list of 'Additional Publication Resources' for a paper by Aad, Georges et al. The resources include X-section U.L. 1 & 2, Exclusion contours 1 & 2 (Obs. and Exp.), and auxiliary exclusion contours. On the right, there are buttons for 'External Link' (Webpage with all figures and tables, arXiv) and 'dat File' (SLHA files for the benchmark signal point). A terminal window in the foreground shows two sets of curl commands for downloading likelihood data for different signal models.

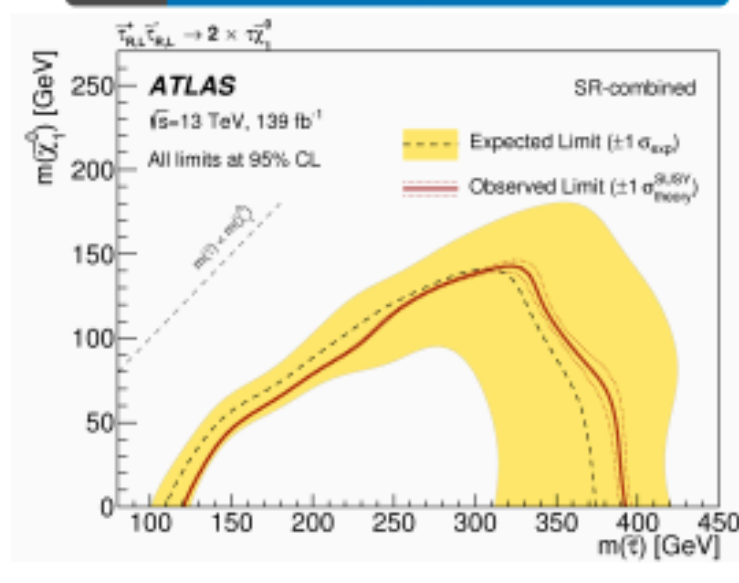

```
# One signal model

## ATLAS releases 'full orchestra' of analysis instruments

01/14/21 | By Stephanie Melchor

The ATLAS collaboration has begun to publish likelihood functions, information that will allow researchers to better understand and use their experiment's data in future analyses.

Meyrin, Switzerland, sits serenely near the Swiss-French border, surrounded by green fields and the beautiful Rhône river. But a hundred meters beneath the surface, protons traveling at nearly the speed of light collide and create spectacular displays of subatomic fireworks inside the experimental detectors of the Large Hadron Collider at CERN.

## New open release streamlines interactions with theoretical physicists

The ATLAS Collaboration has released the first open likelihoods from an LHC experiment.

12th December 2019 | By Katarina Anthony

Explore ATLAS open likelihoods on the HEPData platform. (Original image: Ahmet Anil Sen/Behance)

What if you could test a new theory against LHC data? Better yet, what if the expert knowledge needed to do this was captured in a convenient format? This tall order is now on its way from the ATLAS Collaboration, with the first open release of full analysis likelihoods from an LHC experiment.

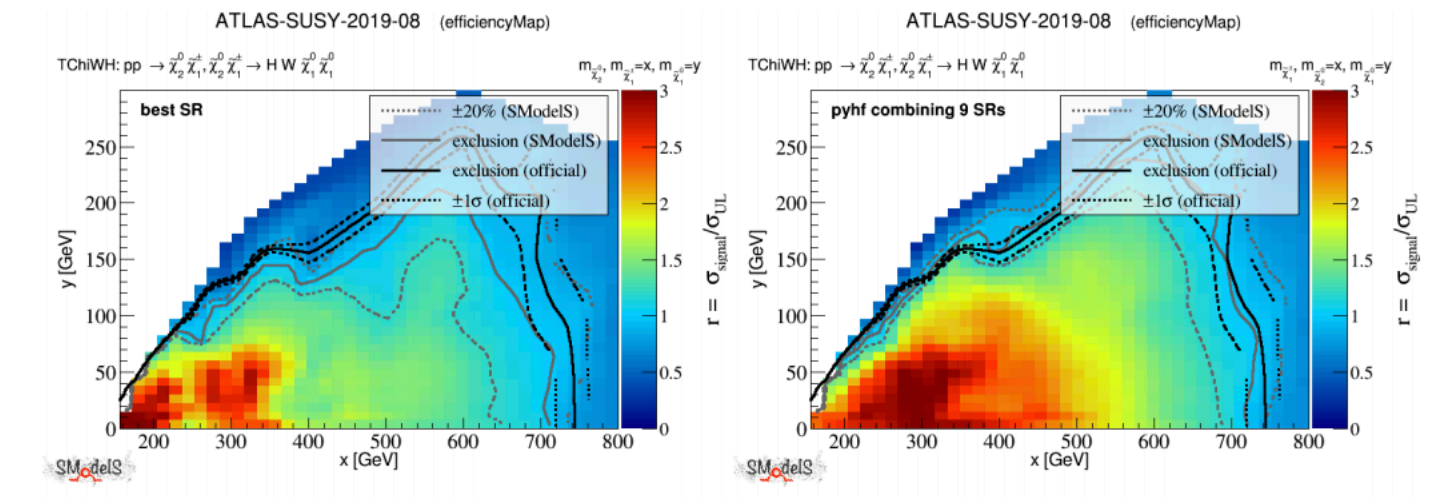

Figure 3: Validation of the TChiWH ( $pp \rightarrow \tilde{\chi}_2^0 \tilde{\chi}_1^\pm, \tilde{\chi}_2^0 \rightarrow h \tilde{\chi}_1^0, \tilde{\chi}_1^\pm \rightarrow W \tilde{\chi}_1^0$ ) result from the ATLAS electroweakino search [23], on the left using the best SR, on the right using the full likelihood.

in accuracy one can reach with using pyhf and full likelihoods. The ATLAS collaboration is at the beginning of a huge effort to provide full statistical models for new analyses. The first analyses published already show how this can help theorists make more trustful reinterpretations. The importance of such likelihood information for, e.g., global fits, has also been emphasised in [2].

### 4. Conclusions

We presented an interface of SModelS to pyhf that enables the use of the full likelihoods provided by ATLAS in the form of pyhf JSON files. The SModelS database was extended by efficiency map results with the corresponding JSON files of three new ATLAS SUSY analyses [16, 17, 23] for full Run 2 luminosity ( $139 \text{ fb}^{-1}$ ).

The new version, SModelS v1.2.4, is publicly available from <https://smodels.github.io/> and can readily be employed for physics studies. We congratulate ATLAS to the important move of making full likelihood information available in digital format and are looking forward to including more such data in future updates of SModelS.

This completes the work started in contribution 15 of [9] for SModelS; the MadAnalysis5 interface to pyhf should become available in the upcoming MadAnalysis5 v1.9 release.

Last but not least we note that the technical discussions with the pyhf team are handled via github's issue tracking system, see e.g. <https://github.com>.

## ATLAS first LHC experiment to push this Open Data frontier

# Analysis Preservation

**Beyond the collision data, ATLAS produced many other types of data**  
**Importantly, the analyses prepared to study the collision data is itself data worth preserving**

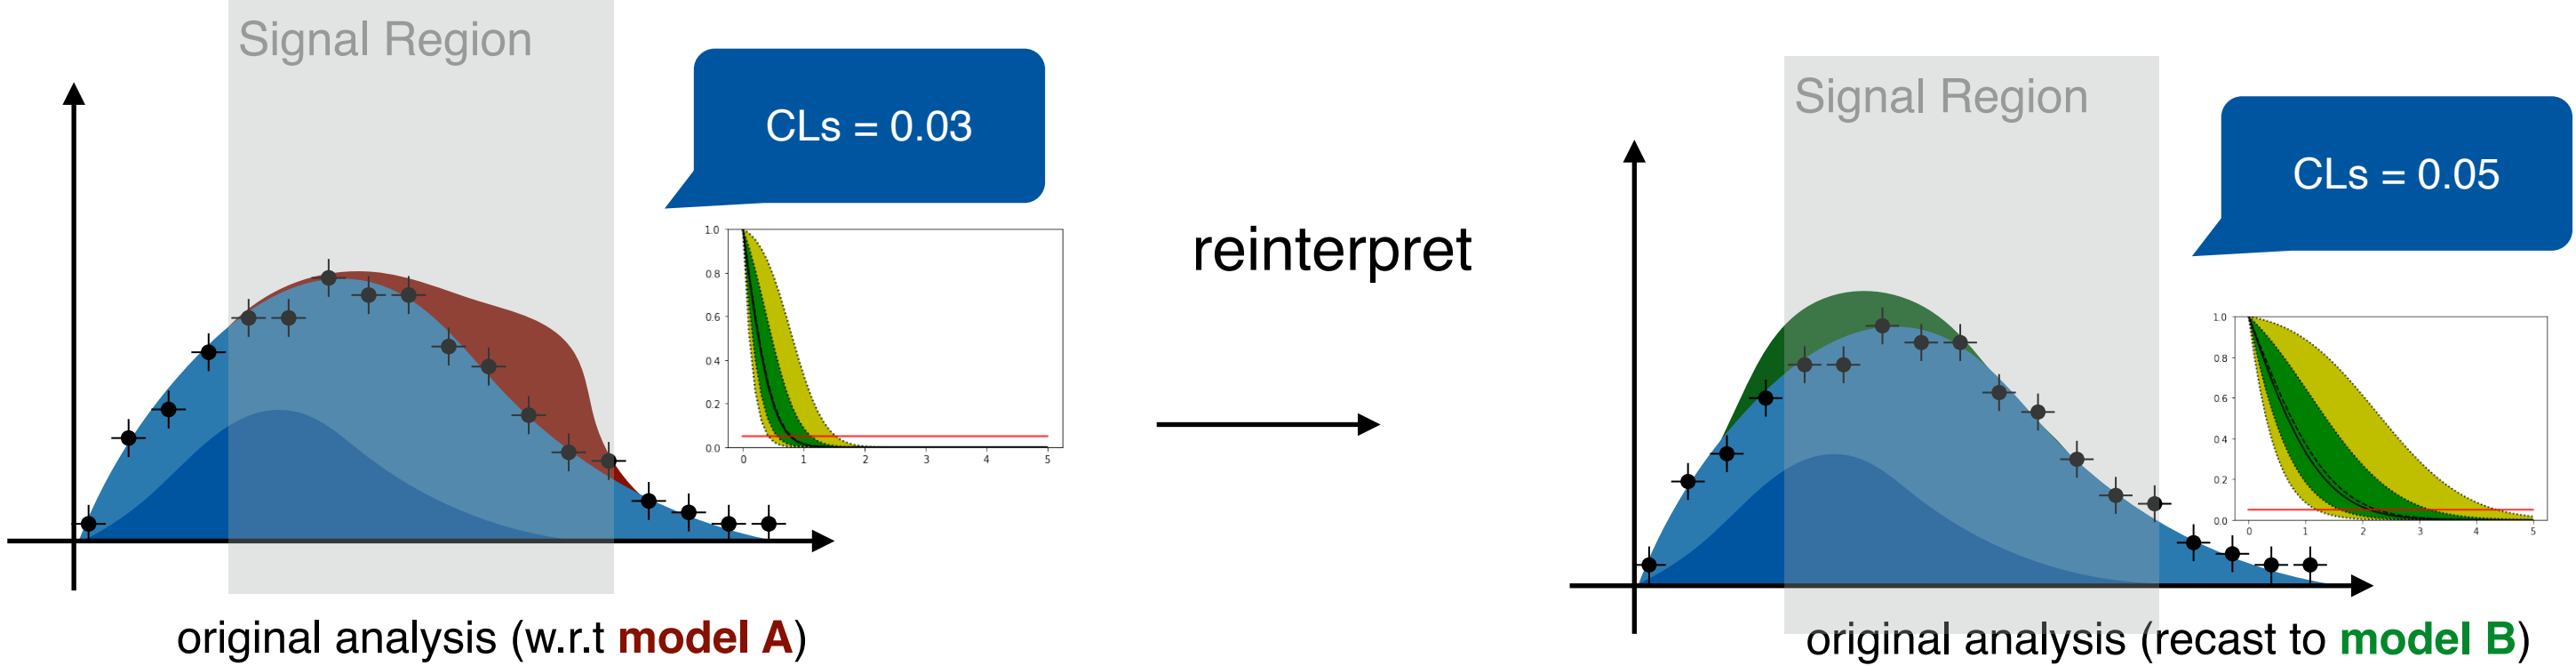

- **historical record of scientific process**
- **useful tool to expand science reach of ATLAS**

**ATLAS is investing in this area internally and works closely w/ CERN to develop and use infrastructure (REANA, CAP)**

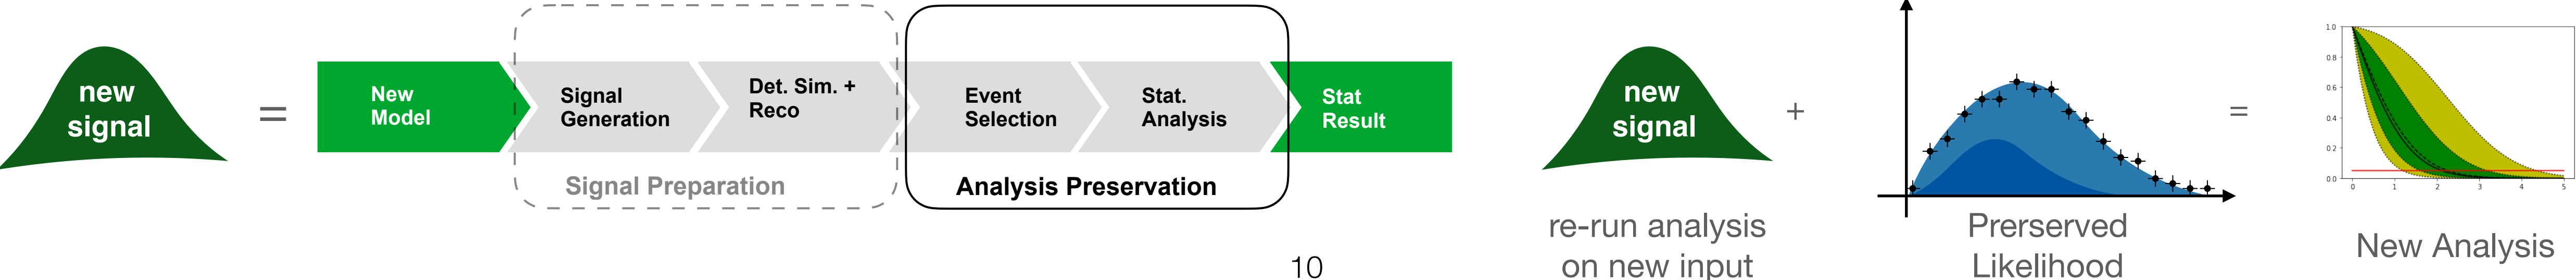

# Analysis Implementations

Important Target for **Reuse Program**: not necessarily the full workflow but special workflows for **reinterpretation of existing analyses (RECAST)**

- answer key question: what can existing analysis say about new theories

- only need to have workflows to re-run analysis on new signal sample

# Simplified Analysis implementations

HEP has long history of releasing simplified Analysis Procedures

- Rivet, HZTool, ... mostly from a Standard Model perspective

ATLAS has internally been developing a library of simplified analyses (SimpleAnalysis) for Beyond-Standard-Model analyses (SUSY, ...)

- This year ATLAS decided to release this library in-bulk!

ATLAS SimpleAnalysis:  
*You can handle the truth!*

Jeanette Lorenz

# RECAST

Preserved Analysis can provide "semi-open" access at a higher, abstract level

- Science Gateway that lets theorists "query" the data ("here's my theory, is it excluded by your data?")

External Scientists

CERN

# Outlook

**ATLAS has a broad Open Science vision focused on providing best tools for external community**

**Recently there have been a number of innovations in various areas**

- **New L3 Open Data policy + first releases**
- **Open Likelihoods**
- **Large-scale release of simplified Analysis Procedures**
- **RECAST & REANA - full analysis preservation**

## **Challenges**

- **we're new to L3 data, looking forward to learning from you**
- **HL-LHC makes analysis preservation even harder**
