Conclusion

From Symmetry Magazine, Feb 2013

Cosmic Gall

- Neutrinos, they are very small.
- They have no charge and have no mass
- And do not interact at all.
- The earth is just a silly ball
- To them, through which they simply pass,
- Like dustmaids down a drafty hall
- Or photons through a sheet of glass.
- They snub the most exquisite gas.
- Ignore the most substantial wall,
- Cold-shoulder steel and sounding brass,
- Insult the stallion in his stall,
 - And, scorning barriers of class,
- Infiltrate you and me! Like tall
- And painless guillotines, they fall
- Down through our heads into the grass.
- At night, they enter at Nepal
- And pierce the lover and his lass
- From underneath the bed-you call
- It wonderful; I call it crass.

<u>Dec 1930:</u> Wolfgang Pauli's letter to physicists at a workshop in Tubingen:

Dear Radioactive Ladies and Gentlemen.

Wolfgang Pauli

......, I have hit upon a desparate remedy to save the "exchange theorem" of statistics and the law of conservation of energy. Namely, the possibility that there could exist in the nuclei electrically neutral particles, that I wish to call neutrons.... The mass of the neutrons should be of the same order of magnitude as the electron mass and in any event not larger than 0.01 proton masses. The continuous beta spectrum would then become understandable by the assumption that in beta decay a neutron is emitted in addition to the electron such that the sum of the energies of the neutron and the electron is constant......

Unfortunately, I cannot appear in Tubingen personally since I am indispensable here in Zurich because of a ball on the night of 6/7 December. With my best regards to you, and also to Mr Back. Your humble servant

1950's: Fred Reines at Los Alamos and Clyde Cowan propose to use the Hanford nuclear reactor (1953) and the new Savannah River nuclear reactor (1955) to find neutrinos.

A detector filled with water with CdCl₂ in solution was located 11 meters from the reactor center and 12 meters underground.

The detection sequence was as follows:

$$1 \bar{\nu_e} + p \rightarrow n + e^+$$

$$2 e^+ + e^- \rightarrow \gamma \gamma$$

3 n+
108
 Cd $ightarrow^{109}$ Cd* $ightarrow^{109}$ Cd+ γ ($au=5\mu$ s).

Neutrinos first detected using a nuclear reactor!

Reines shared 1995 Nobel for work on neutrino physics.

Conclusions

Charge-parity symmetry: laws of physics are the same if a particle is interchanged with its anti-particle and left and right are swapped.

A violation of CP ⇒ matter/anti-matter asymmetry.

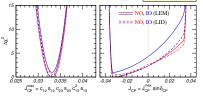

CP Violation in Particle Physics

The Little One

CP Violation

In flavor mixing the degree of CP violation is determined by the Jarlskog invariant:

 $J_{CP}^{PMNS} \equiv \frac{1}{8} \sin 2\theta_{12} \sin 2\theta_{13} \sin 2\theta_{23} \cos \theta_{13} \sin \delta_{CP}$. NuFIT 2.1 (2016) ==== NO. IO (LID) 10

(JHEP 11 (2014) 052, arXiv:1409.5439)

Given the current best-fit values of the ν mixing angles (see here)

$$J_{CP}^{\nu} \approx 3 \times 10^{-2} \sin \delta_{CP}$$
.

Mixing has already been observed between the 3 quark generations):

$$J_{CP}^{quarks} \approx 3 \times 10^{-5}$$
,

despite the large value of $\delta_{CP}^{\text{quarks}} \approx 70^{\circ}$.

Conclusions

 $u_{\mu} \rightarrow \nu_{e}$ oscillations are sensitive to all mixing parameters contributing to the Jarlskog invariant. With terms up to second order in $\alpha \equiv \Delta m_{21}^2/\Delta m_{31}^2 = 0.03$ and $\sin^2 \theta_{13} = 0.02$, (M. Freund. Phys. Rev. D 64, 053003): $P(\nu_{\mu} \rightarrow \nu_{e}) \cong P(\nu_{e} \rightarrow \nu_{\mu}) \cong P_{0} + P_{\sin \delta} + P_{\cos \delta} + P_{3}$

where for oscillations in vacuum:

$$P_0 = \sin^2 \theta_{23} \sin^2 2\theta_{13} \sin^2(\Delta),$$

$$P_{\sin \delta} = \alpha 8 J_{cp} \sin^3(\Delta),$$

$$P_{\cos \delta} = \alpha 8 J_{cp} \cot \delta_{CP} \cos \Delta \sin^2(\Delta),$$

$$P_3 = \alpha^2 \cos^2 \theta_{23} \sin^2 2\theta_{12} \sin^2(\Delta),$$

where $\Delta = 1.27 \Delta m_{31}^2 L/E$

For
$$\bar{\nu}_{\mu} \rightarrow \bar{\nu}_{e}$$
, $\underbrace{\mathsf{P}_{\sin\delta} \rightarrow -\mathsf{P}_{\sin\delta}}_{\text{CP asymmetry } (\delta \neq 0)}$,

$\nu_{\mu} \rightarrow \nu_{\rm e}$ Oscillations

The Little eutral One

contributing to the Jarlskog invariant. With terms up to second order in $\alpha \equiv \Delta m_{21}^2 / \Delta m_{31}^2 = 0.03$ and $\sin^2 \theta_{13} = 0.02$, (M. Freund. Phys. Rev. D 64, 053003):

$$P(\nu_{\mu} \rightarrow \nu_{e}) \cong P(\nu_{e} \rightarrow \nu_{\mu}) \cong \underbrace{P_{0}}_{\theta_{13}} + \underbrace{P_{\sin\delta}}_{CP \text{ violating}} + \underbrace{P_{\cos\delta}}_{CP \text{ conserving}} + \underbrace{P_{3}}_{solar \text{ oscillation}}$$

where for oscillations in matter with constant density:

 $\nu_{\mu} \rightarrow \nu_{\rm e}$ oscillations are sensitive to all mixing parameters

$$\begin{array}{rcl} P_0 & = & \sin^2\theta_{23} \frac{\sin^22\theta_{13}}{(A-1)^2} \sin^2[(A-1)\Delta], \\ \\ P_{\sin\delta} & = & \alpha \frac{8J_{cp}}{A(1-A)} \sin\Delta\sin(A\Delta)\sin[(1-A)\Delta], \\ \\ P_{\cos\delta} & = & \alpha \frac{8J_{cp}\cot\delta_{CP}}{A(1-A)} \cos\Delta\sin(A\Delta)\sin[(1-A)\Delta], \\ \\ P_3 & = & \alpha^2\cos^2\theta_{23} \frac{\sin^22\theta_{12}}{A^2} \sin^2(A\Delta), \end{array}$$

where $\Delta = 1.27 \Delta m_{31}^2 L/E$ and $A = \sqrt{2}G_E N_e 2E/\Delta m_{31}^2$

For
$$\bar{\nu}_{\mu} \to \bar{\nu}_{e}$$
, $\underbrace{\mathsf{P}_{\sin\delta} \to -\mathsf{P}_{\sin\delta}}_{\text{CP asymmetry } (\delta \neq 0)}$, matter asymmetry

Expected Appearance Signal Event Rates

The Little **J**eutral One

CP Violation

 ν Exercise: The total number of electron neutrino appearance events expected for a given exposure from a muon neutrino source as a function of baseline is given as

$$\mathsf{N}_{\nu_{\mathsf{e}}}^{\mathrm{appear}}(\mathsf{L}) = \int \Phi^{\nu_{\mu}}(\mathsf{E}_{\nu},\mathsf{L}) \times \mathsf{P}^{\nu_{\mu} \to \nu_{\mathsf{e}}}(\mathsf{E}_{\nu},\mathsf{L}) \times \sigma^{\nu_{\mathsf{e}}}(\mathsf{E}_{\nu}) \mathsf{d}\mathsf{E}_{\nu}$$

Assume the neutrino source produces a flux that is constant in energy and using only the dominant term in the probability(no matter effect)

$$\begin{array}{lcl} \Phi^{\nu_{\mu}}(\mathsf{E}_{\nu},\mathsf{L}) & \approx & \frac{\mathsf{C}}{\mathsf{L}^2}, \quad \mathsf{C} = \mathbf{number} \ \mathbf{of} \ \nu_{\mu}/\mathsf{m}^2/\mathsf{GeV/sec} \ \mathbf{at} \ 1 \ \mathsf{km} \\ \mathsf{P}^{\nu_{\mu} \to \nu_{e}}(\mathsf{E}_{\nu},\mathsf{L}) & \approx & \underbrace{\sin^2\theta_{23}\sin^22\theta_{13}\sin^2(1.27\Delta m_{31}^2\mathsf{L}/\mathsf{E}_{\nu})}_{\mathsf{P}_{0}} \\ \\ \sigma^{\nu_{e}}(\mathsf{E}_{\nu}) & = & 0.7 \times 10^{-42} (\mathsf{m}^2/\mathsf{GeV/N}) \times \mathsf{E}_{\nu}, \quad \mathsf{E}_{\nu} > 1 \ \mathsf{GeV} \end{array}$$

Prove that the rate of ν_e appearing integrated over a constant range of L/E is independent of baseline for L > 500 km!

Expected Appearance Signal Event Rates

The Little **J**eutral One

 $C \approx 1 \times 10^{17} \ \nu_{\mu}/m^2/GeV/yr$ at 1 km (from 1MW accelerator) $\sin^2 2\theta_{13} = 0.084$, $\sin^2 \theta_{23} = 0.5$, $\Delta m_{31}^2 = 2.4 \times 10^{-3} eV^2$

 $N_{\nu_e}^{appear}(L) \propto {constant~term} \times \int {{sin^2(ax)}\over {x^3}} dx,$

 $x \equiv L/E_{\nu}$, $a \equiv 1.27\Delta m_{31}^2 \text{ GeV}/(\text{eV}^2.\text{km})$

Calculate the rate of ν_e events observed per kton of detector integrating over the region x = 100 km/GeV to 2000 km/GeV. Use ROOT to do the integral!

CP Violation

Expected Appearance Signal Event Rates

$$\nu$$
 Exercise:

C $\approx 1 \times 10^{17} \ \nu_{\mu}/\mathrm{m}^2/\mathrm{GeV/yr}$ at 1 km (from 1MW accelerator) $\sin^2 2\theta_{13} = 0.084, \ \sin^2 \theta_{23} = 0.5, \Delta m_{31}^2 = 2.4 \times 10^{-3} \mathrm{eV}^2$

 $N_{\nu_e}^{\text{appear}}(L) \propto \text{constant term} \times \int \frac{\sin^2(ax)}{x^3} dx,$ $x \equiv L/E_{\nu}$, $a \equiv 1.27\Delta m_{31}^2 \text{ GeV}/(\text{eV}^2.\text{km})$

CP Violation

Calculate the rate of ν_e events observed per kton of detector integrating over the region x = 100 km/GeV to 2000 km/GeV. Use ROOT to do the integral!

$$N_{\nu_e}^{appear}(L) \approx (2 \times 10^6 \text{events/kton/yr}) \cdot (\text{km/GeV})^2 \int_{x_0}^{x_1} \frac{\sin^2(ax)}{x^3} dx,$$

$$N_{\nu_e}^{appear}(L) \sim \mathcal{O}(20-30) \text{ events/kton/yr}$$

1 ZI (Zetaloule)= 103 EI(Exaloule)= 1021 I(Joule)

Requires proton accelerators with powers of 10 MW. Currently neutrino and neutron experiments are driving the technology of high power MW class proton beams.

u Mixing

Example Expts
Reactor ν T2K

CP Violation

u Apps

- Neutrinos have been at the forefront of fundamental discoveries in particle physics for decades.
- Discoveries of neutrino properties like the very small mass, large almost maximal mixing, are the ONLY direct evidence for physics beyond the Standard Model of particle physics, and new hidden symmetries.
- Results from the current generation of accelerator based neutrino experiments hint (inconclusively) at large matter/anti-matter asymmetries.
- The future T2HK and LBNF/DUNE project are ambitious multi-national neutrino experiments designed to probe matter/anti-matter asymmetries, neutrino oscillations and cosmological neutrinos with unprecedented precision.
- Studying neutrinos is advancing new technologies in accelerators, non-proliferation, geology...etc
