

# Security by default: The importance of lean systems

*Monday, 11 October 2010 13:30 (30 minutes)*

There are a few very well-known security principles in information security such as security by default, security in depth. However, in reality we have seen that people very often overlook some simple but important details, which might eventually lead to a system being compromised. This presentation will give a few examples and observations that we have seen in our day to day operation and try to explore the ways of how Quattor can help improve or enhance security.
