Exercise 1(a)

Create a Box of 25cm x 25cm x 50cm filled with liquid Argon

Take size of world box: 1m x1m x 3m.

Take Material of world box: Air

(Detector Construction Class)

Define Detetector Materials:

Air in World Volume Liquid Ar in Box

```
void B4DetectorConstruction::DefineMaterials()
  // Liquid argon material
G4double a; // mass of a mole;
  G4double z; // z=mean number of protons;
  G4double ncomponents, fractionmass;
  G4double density:
  new G4Material("liquidArgon", z=18., a= 39.95*g/mole, density= 1.390*g/cm3);
         // The argon by NIST Manager is a gas with a different density
//Air
a = 14.01*q/mole;
G4Element* elN = new G4Element("Nitrogen", "N", z= 7., a);
a = 16.00*g/mole;
G4Element* el0 = new G4Element("Oxygen", "0", z= 8., a);
density = 1.290*mg/cm3;
G4Material* Air = new G4Material("Air", density, ncomponents=2);
Air->AddElement(elN, fractionmass=0.7);
Air->AddElement(el0, fractionmass=0.3);
  // Print materials
 G4cout << *(G4Material::GetMaterialTable()) << G4endl;
```

(Detector Construction Class)

Create Geometry

```
// Create World Volume
 G4double world x = 1.0*m:
 G4double world v = 1.0*m:
 G4double world z = 3.0*m;
'/This creates a box named ; World; with the extent from -1.0 to 1.0 meters in
\checkmark -1.0 meters to +1.0 meters along the Y axis and from -3.0 to 3.0 meters in Z.
Note that the G4Box constructor takes as arguments the halves of the total box
ize.
G4Box* WorldBox = new G4Box("World", world_x, world_y, world_z); // its name and
     G4LogicalVolume* WorldLV
    = new G4LogicalVolume(
                                   // its solid
                 WorldBox.
                 WorldMaterial, // its material
                 "World");
                                   // its name
  G4VPhysicalVolume* WorldPV
    = new G4PVPlacement(
                                   // no rotation
                 G4ThreeVector(), // at (0,0,0)
                 WorldLV.
                                 // its logical volume
                 "World",
                                  // its name
                                  // its mother volume
                 false.
                                  // no boolean operation
                                   // copy number
                 fCheckOverlaps); // checking overlaps
```

```
G4double box x = 25.0*cm;
 G4double box v = 25.0*cm;
 G4double box z = 50.0*cm;
//This creates a box named ; box; with the extent from -25.0 to 25.0 cm in X,
-25cm to 25cm along the Y axis and from -50cm to 50cm in Z. Note that the G4Box
constructor takes as arguments the halves of the total box size.
4Box* smallBox = new G4Box("Box", box_x, box_y, box_z); // its name and size
 G4LogicalVolume* BoxLV
   = new G4LogicalVolume(
              smallBox.
                               // its solid
              BoxMaterial, // its material
                            // its name
              "Box"):
 G4PVPlacement* BoxPV = new G4PVPlacement(
                              // no rotation
              G4ThreeVector(0,0,0), // at (0,0,0)
              BoxLV,
                           // its logical volume
              "Box", // its name
                              // its mother volume
              WorldLV,
                             // no boolean operation
              false,
                              // copy number
              fCheckOverlaps); // checking overlaps
```

How to Run Exercise 1(a)

\$ cd Exercise1

Our first step is to create a build directory in which build the example. We will create this alongside our example source directory as follows:

\$ mkdir BOX-build

\$ cd BOX-build

Now run CMake to generate the Makefiles needed to build example

\$ kavita@kavita: ~/Geant4_BAW_2019/exercise/Exercise1/BOX-build\$ cmake -Dgeant4_DIR=/home/kavita/BAW_2019/geant4-install/

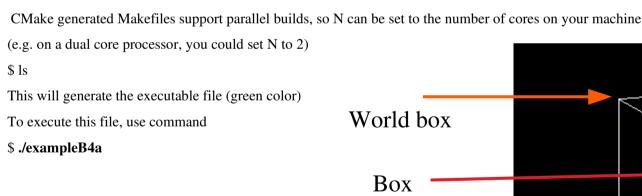

lib/Geant4-4.10.05 <space> /home/kavita/Geant4_BAW_2019/exercise/Exercise1/BOX

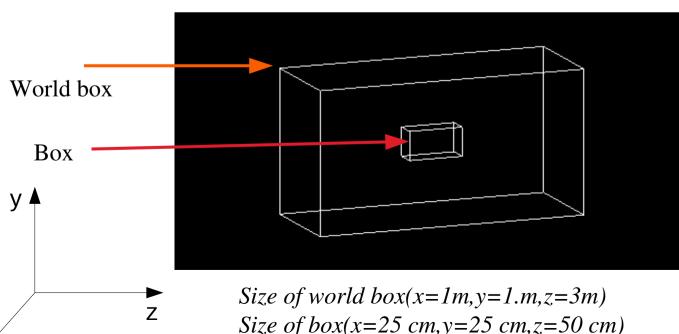

Note the Makefile and that all the scripts for running the example application we're about to build have been copied across.

With the Makefile available, we can now build by simply running make:

\$ make -jN(N is the no of core of your system)

Visualization

Exercise 1(b)

Rotate the inside box by 90 deg along X axis with respect to its mother volume.

In GEANT 4, the rotation matrix associated to a placed physical volume represents the rotation of the reference system of this volume with respect to its mother. A rotation matrix is normally constructed as in CLHEP, by instantiating the identity matrix and then applying a rotation to it

Script *Rotation for Coordinate system

```
//======Rotate inside box by 90 degree with respect to its mother volume
// Rotate box 90 degree from X axis
G4RotationMatrix* boxRot = new G4RotationMatrix();
boxRot->rotateX(90.*deg):
new G4PVPlacement(
              boxRot.
              G4ThreeVector(0,0,0), // at (0,0,0)
              BoxLV, // its logical volume
              "Box", // its name
              WorldLV, // its mother volume
             false, // no boolean operation
             0, // copy number
              fCheckOverlaps); // checking overlaps
```

Visualize the Gemotry?

Exercise 1(c)

Generate the electron beam of energy 50 MeV in extercise 1(a).

Turn On the Electron beam of energy 50MeV in the Exercise1(a). (PrimaryGeneratorAction Class)

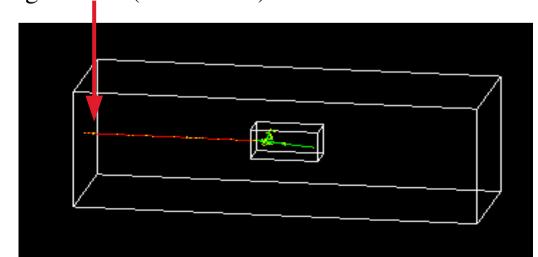

Generate beam (particle type,momentum Direction,Energy) ### default particle kinematic // auto particleDefinition = G4ParticleTable::GetParticleTable()->FindParticle("e-"); fParticleGun->SetParticleDefinition(particleDefinition); fParticleGun->SetParticleMomentumDirection(G4ThreeVector(0.,0.,1.)); fParticleGun->SetParticleEnergy(50.*MeV); // Set gun position fParticleGun ->SetParticlePosition(G4ThreeVector(0., 0., -1.5*m)); fParticleGun->GeneratePrimaryVertex(anEvent);

• Turn On Beam-

\$./exampleB4a (name of executable file) on viewer screen type /run/beamOn 1 (no of events)

Visualization

Incoming e- beam(Red colour)

Exercise 2: Create a Sphere of inner radius of 70cm & outer radius 90cm, filled with liquid Argon. Take size of world box of 1m x 1m x 3m filled with Air.

Exercise 2: Create a Sphere

- **Define materials-** Take help from exercise 1
- Create World Take help from exercise 1
- Create Solid Sphere-

Visualization

```
to SphereLV =
   new G4LogicalVolume(sphere,
                                         //its solid
                       SphereMaterial,
                                               //its material
                       "Sphere"):
                                              //its name
new G4PVPlacement(0.
                                           //no rotation
                   G4ThreeVector(),
                                            //at (0,0,0)
                   SphereLV,
                                       //its logical volume
                   "Sphere",
                                          //its name
                  WorldLV.
                                        //its mother volume
                                           //no boolean operation
                  false,
                                           //copy number
                  fCheckOverlaps);
                                           // checking overlaps
```

World Volume

Exercise 3 (a)

Create a Tube of inner radius of 30cm, outer radius of 70cm and half length in z of 100cm filled with liquid Argon.

Take size of world in a world of 1m x1m x 3m filled with Air.

Ex. 3 (a) Construction of Tube (Detector Construction Class)

- **Define materials- Take the help from** exercise 1 OR 2.
- Create World Take the help from exercise 1 OR 2.

Create Tube-

G4double rmin = 30.*cm:

```
G4double rmax = 70.*cm:
G4double zh = 100*cm:
G4double thmin = 0*deg;
G4double thmax = 360*deg;
G4Tubs* TubS = new G4Tubs("Tube", rmin, rmax, zh, thmin, thmax);
G4LogicalVolume* TubLV
 = new G4LogicalVolume(
             TubS, // its solid
             TubeMaterial, // its material
                                                       Tube
              "Tube"); // its name
G4PVPlacement* TubPV = new G4PVPlacement(0,
                                         //no rotation
                G4ThreeVector(),
                                       //at (0,0,0)
                       //its logical volume
                TubLV,
                "Tube",
                                   //its name
                WorldLV. //its mother volume
                                   //no boolean operation
               false,
                                     //copy number
               0,
               fCheckOverlaps);
                                     // checking overlaps
                                             World Volume
```

Visualization

Exercise 3 (b)

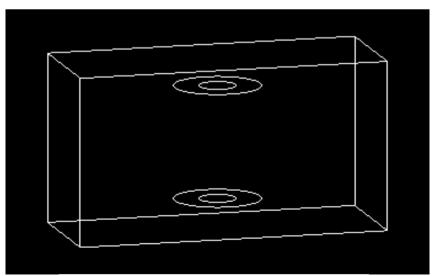

- 1. Rotate the Tube by 90 degree from X-axis in Exercise 3(a).
- 2. Fill the Surface/Edge in Exercise 3(a)

Ex. 3(b): Rotate the Tube by 90 degree from X-axis in Exercise 3(a). (DetectorConstruction Class)

In Geant4, the rotation matrix associated to a placed physical volume represents the rotation of the reference system of this volume with respect to its mother.

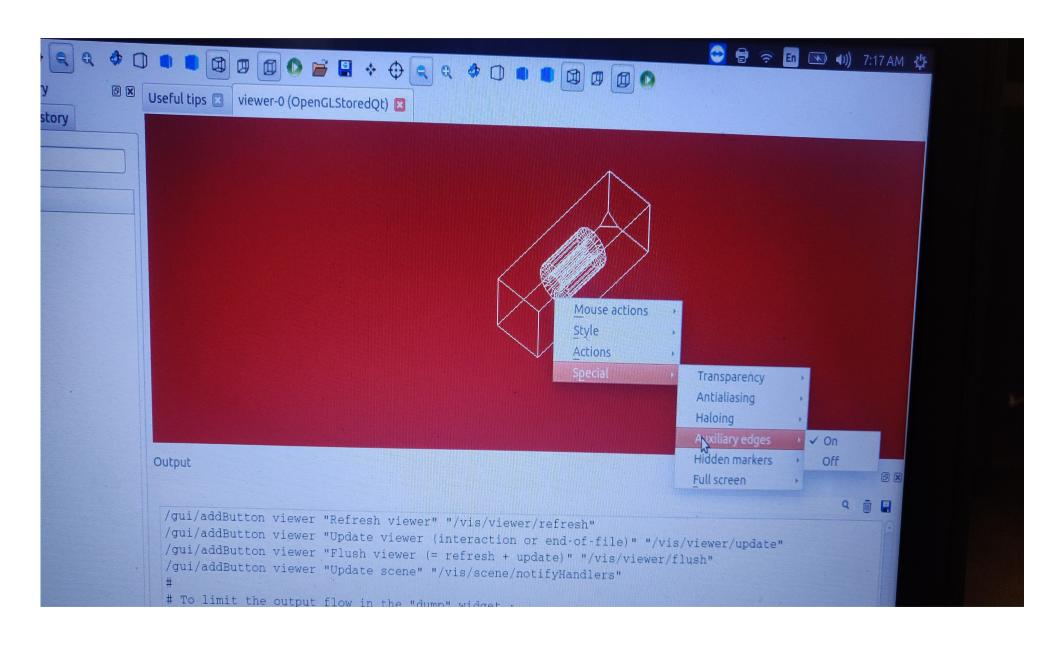

A rotation matrix is normally constructed as in CLHEP, by instantiating the identity matrix and then applying a rotation to it

G4RotationMatrix* TubeRot = new G4RotatlinMatrix();

Tube rotated by 90 deg from X-axis

How to fill the edge OR surface of Tube

Exercise-4

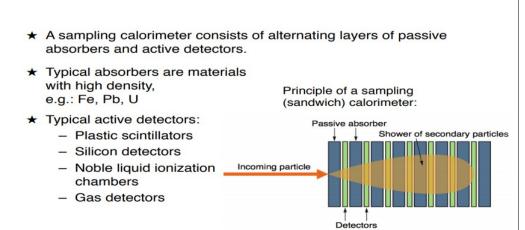

Design a calorimeter of 10 layers:

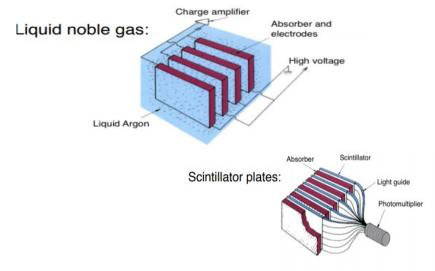

Each layer consists one absorber layer + one gap layer

Size of absorber layer is 5cm x 5cm x 5mm Material of absorber layer is lead

Size of gap layer is 5cm x 5cm x 2.5mm, Material of gap layer is liquid argon,

Take World Box size of 6cm x 6cm x 18cm, Take Material of World box Galactic,

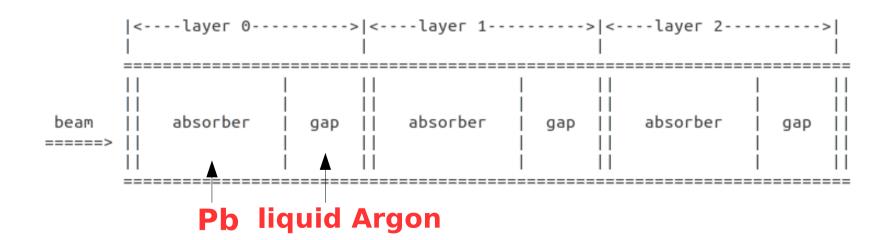

Ex. 4: Design of Calorimeter

(Detector Construction class)

Geometry:

- The calorimeter is a box made of a given number of layers. A layer consists of an absorber plate and of a detection gap.
- The absorber plate contains lead (Pb) and the gap contains liquid Argon.
- The layer is then replicated using **G4PVReplica** Class.

Ex. 4: Calorimeter Geometry (DetectorConstructionClass)

Create Geometry

```
// World
auto worlds
 = new G4Box("World",
                      // its name
             worldSizeXY/2, worldSizeXY/2, worldSizeZ/2); // its size
auto worldLV
 = new G4LogicalVolume(
                        // its solid
             worlds,
             defaultMaterial, // its material
             "World"):
                             // its name
auto worldPV
 = new G4PVPlacement(
                             // no rotation
             G4ThreeVector(), // at (0,0,0)
             worldLV, // its logical volume
             "World",
                      // its name
                            // its mother volume
             false, // no boolean operation
                             // copy number
             fCheckOverlaps); // checking overlaps
```

```

Root Output file

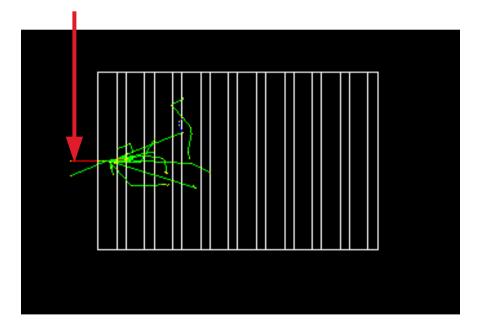

Visualization of Geometry (Calorimeter)

Beam off

Beam on

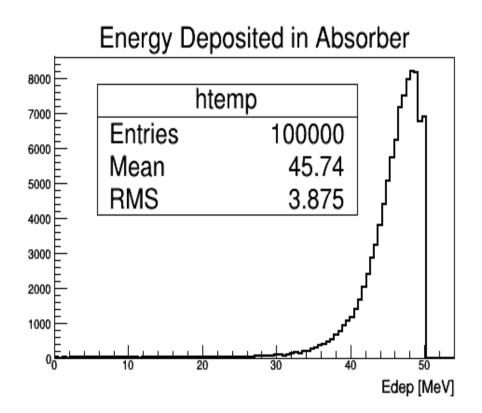

Incoming e- beam of energy 50 MeV

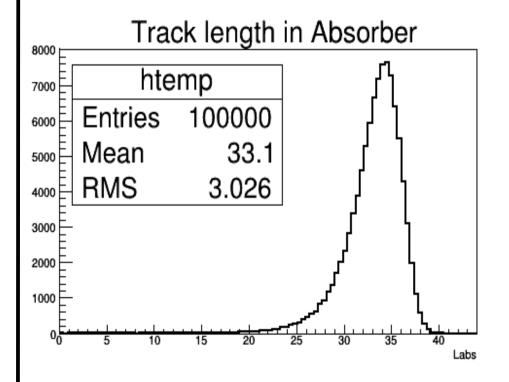

Energy Deposited and Track length (ROOT Output)

(Stepping Action Class and Event Action Class)

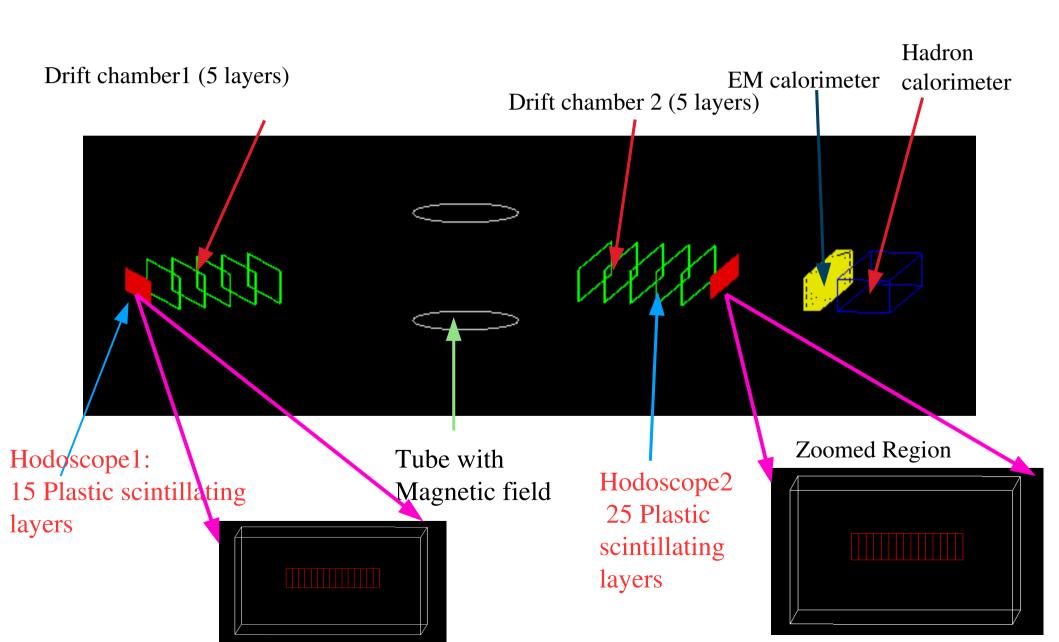

Stepping Action Class provide Energy Dep. And track length on each step

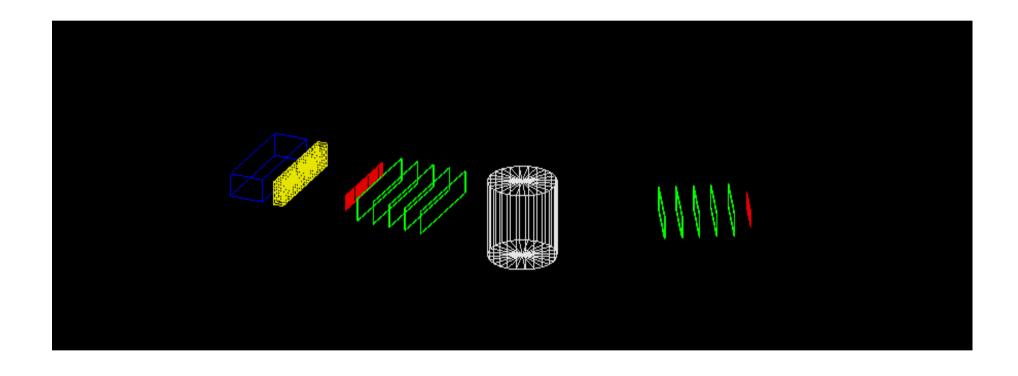

Event Action Class stores the Edep and track Length event by event at each step in Ntuples & histograms

Ex. 5: Construct a Detector Setup consisting of two hodoscope, two drift chambers, Electromagnetic Calorimeter, Hadron Calorimeter

Fill the tube edge/surface

How to change OR control beam parameter (particle, beam energy and number of events using external mac file?

Why do we want to control externally?

```
# muon 300 MeV in direction (0.,0.,1.)
# 3 events
#
/gun/particle mu+
/gun/energy 3 MeV
/run/beamOn 3
#
```
