# Gas detector in ATLAS experiment Francesco Soddu, Maria Matilde Stellini

ITALIAN HSSIP 2022

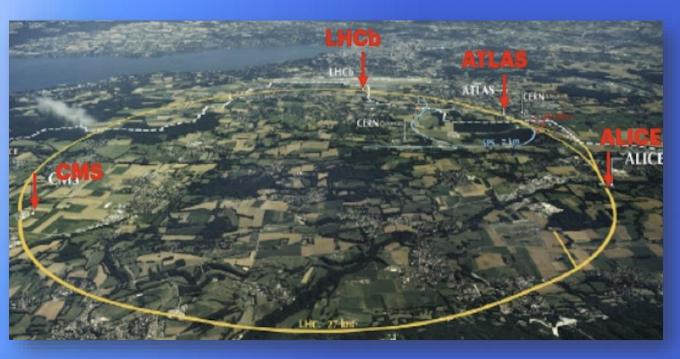

### Overview

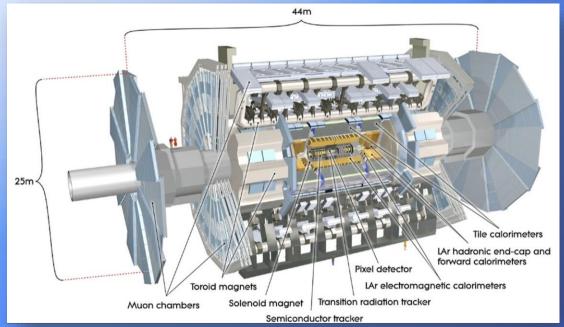

- LHC and the ATLAS experiment
- Detector used: *Micromegas*
- Measurement of the *Gain*
- Collection of the **Data**
- Data Analysis
- Conclusions

# LHC AND ATLAS EXPERIMENT

LHC is the Large Hadron Collider, with a diameter of 27 km.

One of its collision point is where the ATLAS experiment lies

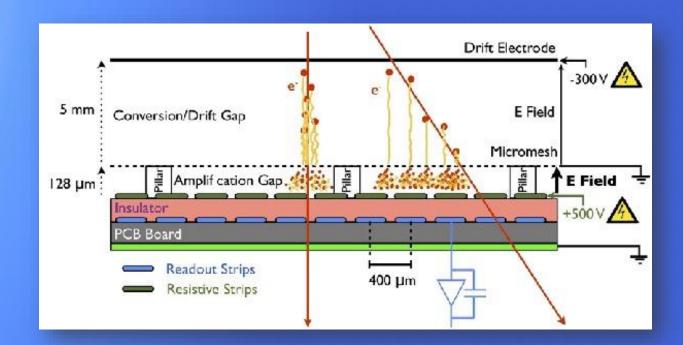

ATLAS (A Toroidal LHC ApparatuS) is a general purpose experiment. It consists in several different detectors, including trackers, calorimeters and the muon spectrometer system.

### Micromegas

'Micro Mesh Gaseouse Structure'

- Micro pattern gas detector with 1024 read-out strips
- It contains Argon (Ag) and Carbonic Dioxide (CO2) that come in different proportions
- It is made of **3 planes:** the drift electrode, the mesh and the read-out strips
- It detects particles with a high spatial precision

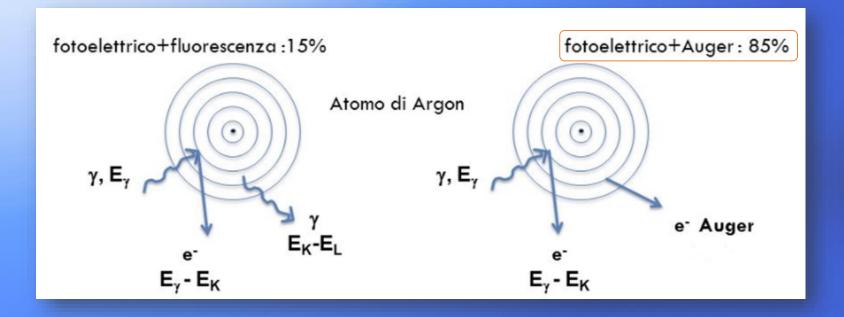

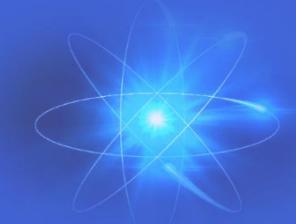

#### THE RADIOACTIVE SOURCE

- The <sup>55</sup>Fe is the radioactive source used.
   Since it is instable, it decades in <sup>55</sup>Mn
- The physics process that happens inside the chamber is the following: when the photon enters the drift region it ionizes the gas and forms an electron-ion couple

$$^{55}Fe \rightarrow ^{55}Mn^* + v_e$$

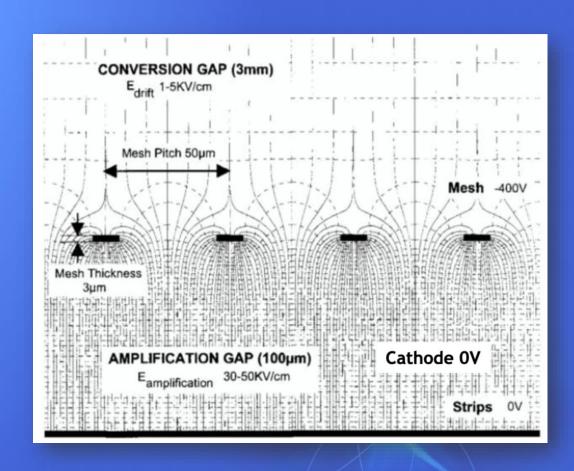

$$^{55}Mn^* \rightarrow ^{55}Mn + \gamma$$

#### The electric field

Once the electrons are in the amplification region additional electron-ion couples are formed so an electron avalanche is created because of the strong acceleration of the particles due to the electronic field.

## The gain measurement

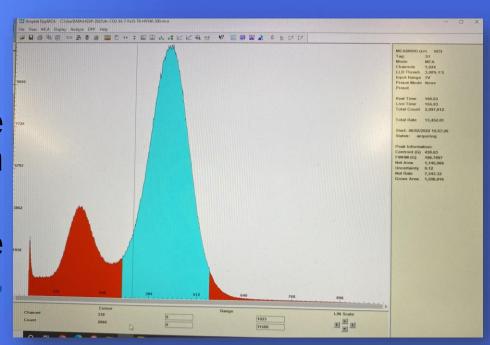

- The gain is the moltiplicative factor of the primary ionization charge
- The gain depends on electrical fields ratio between the two regions, therefore it can be measured as the ratio of the voltage provided to the drift and read-out plans

• Gain 
$$=\frac{N}{N_0}$$

N<sub>0</sub> stands for the number of the primary electron-ion couples in the drift region
N stands for the number of electrons that are formed in the amplification region

# Collecting data

- By fixing the drift voltage to -300 V the read-out voltage has been changed with steps of 10 V
- Four different proportion of gas were used: Ag 93%- CO2 7%, Ag 90%-CO2 10%, Ag 85%-CO2 15%, Ag 80%- CO2 20%
- For every proportion it has been measured the signal corresponding to the Auger effect
- Then the gain trend as a function of the read-out voltage has been calculated

## Data analysis

The data have been collected with a software used in the laboratory and analysed with Excel.

The analysis has been done in two different ways:

1. Manually, measuring the average value of the read signal

Hv	Centroid										
450	88		Ag= 93%	Co2=7%							
460	121										
470	168	V <sub>monito</sub>	V <sub>monitored</sub> [V] tension in fuction of the centroid								
480	232	1800									
490	320										
500	441	1600				,					
510	604	1400									
520	816	1200				1					
530	1165	1000									
540	1622	800									
		600									
		400									
		200									
		0									
		44	40 460	480	500	520	540 560				
							$V_{read-out}[V]$				

			Ag=90%	Co2=109	6						
11	Cambuald										
Hv	Centroid	v ry Centroid									
460	90	v <sub>monitored</sub> [v]									
470	124	1600									
480	171	1400									
490		1200									
500		1000						1			
510		800									
520											
530		600									
540		400				4					
550	1470	200									
		0									
			440 46	50 48	0	500	520	540	560		
							,	$V_{read-out}[V]$			

# Data analysis

2. In a mathematical way, by fitting the signal with a gaussian function

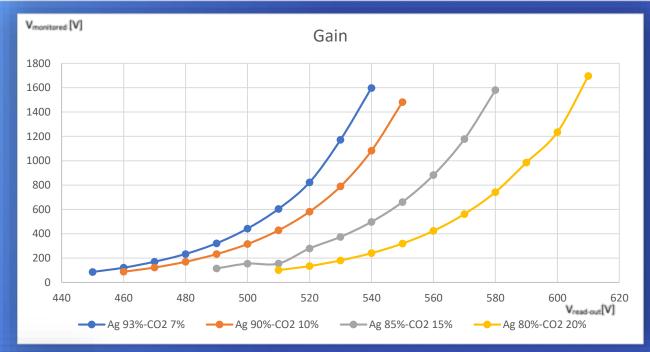

$$A e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

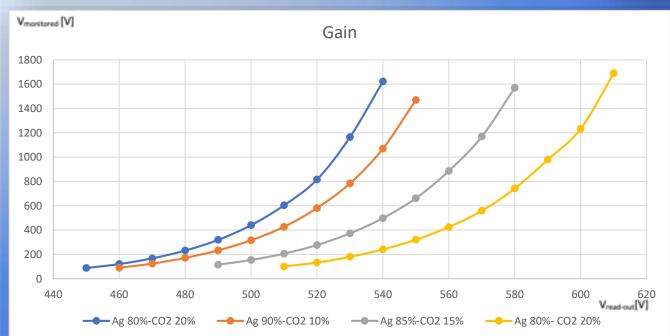

Then the best fit of every gaussian function has been calculated and the mean parameter has been used for the gain calculation

#### Gain measurement

 In conclusion the graphics of the two different analysis have been compared

#### The mathematical way

The approximated manual way

#### conclusions

- What we have calculated it is not precisely the gain but it is a measurement that is proportional to it
- The data have an esponential trend
- It should be added a sperimental error to the data which is related to both the inaccurate manual measurement and the fit's parameter (μ) → but for practical impossibilities we didn't have the chance to get them

# THANKS FOR THE ATTENTION!
