

GGUS news: fields, workflows, reports

October 2011 GDB

2011/10/12

Maria Dimou

- Since January 2010 it is possible to open a GGUS ticket on behalf of a 3rd party and getting out of the loop (dev. item <https://savannah.cern.ch/support/?111183>).
- This was done in the hope of getting all existing expertise in web pages accessible by the Grid Authorised users instead of email threads.
- Nevertheless, the LCG-ROLLOUT remains very busy, so, maybe a reminder is in order.

- GGUS offers the TEAM and ALARM ticket functionality which allows co-ownership of tickets, across experiment shifts and automatic registration of authorised TEAMers and ALARMers from the experiment authorities into GGUS via VOMS.
- ALARM tickets, in particular, automatically send SMS messages to experts on call day and night. Operators call the relevant service piquet also 24/7.
- The T0 services and all T1s are present at the daily WLCG Operations' meeting for close ticket follow-up.
- 'GGUS issues' i.e. tickets not getting prompt support are collected and discussed every Thursday.

... and more

- If the issue is not CERN only but requires advice by other sites or developers (e.g. MyProxy bug), GGUS allows contribution of all supporters world-wide.
- Middleware-related GGUS tickets guarantee the provision according to the SLA signed between EGI and EMI.
- One can reference a GGUS URI from any document.
- GGUS ALARM tickets' drills are prepared for every WLCG MB. Any problems in the workflow or the quality of support are identified and followed-up, as appropriate.
- GGUS total figures for the LHC experiment VOs are maintained up-to-date on:
<https://twiki.cern.ch/twiki/pub/LCG/WLCGOperationsMeetings/ggus-tickets.xls>

As of the 2011/09/28 GGUS Release 'Type of Problem' (ToP) values:

- Databases
- File Access
- File Transfer
- Local Batch System
- Middleware
- Monitoring
- Network problem
- Storage Systems

This is a subset of ToP values that user tickets offer.

The same exact strings were kept for these values so that:

- Searches can give all tickets created before and after this release.
- USER, TEAM or ALARM tickets can be grouped together in statistics.
- Interfaces with other ticketing systems don't break (for those which map this field).
- Other VOs using TEAM (BIOMED) or ALARM tickets see values common to all.

Chronologically:

1. CHEP 2010 GGUS statistics showed that LHC VOs use mostly TEAM & ALARM tickets where a ToP field didn't exist, so no conclusions per service could be drawn.
2. Dec. 2010: 1st T1SCM (indico confId=116629) presentation ([slide 5](#))
3. June 2011: 2nd T1SCM (indico confId=143633) presentation ([slides](#))
4. Values' proposal

So far WLCG uses:

- Weekly escalation reports with total number of tickets per VO (USER, TEAM, ALARM).
- Quarterly metrics' reports for EGI on "meantime to resolution" for true ALARM tickets per VO.
- In the pipeline: quarterly metrics' reports on "meantime to resolution" per T0/T1 site.
- More requirements? Please open a GGUS ticket a.s.a.p.

- About 23 new features are put in operation with every monthly GGUS release. All requests are carefully evaluated.
- This is possible due to the valuable work of GGUS developers and the excellent collaboration with WLCG Experiment Support.
- The projects, ticketing systems and sites/ROCs/NGIs interfacing to GGUS are Many and increasing.
- The development of a fail-safe system from the web interface (pending) to the backend database (done) is very important. Progress follow-up via ticket:
<https://savannah.cern.ch/support/?113831>

»Thank You!
