Integration of CERNBox in the DBOD service

Wednesday 8 December 2021 16:15 (15 minutes)

The Database on Demand service is a DBaaS (database as a service) that empowers CERN users to create and manage MySQL, PostgreSQL and InfluxDB database server instances by means of a simple and intuitive web interface.

The DBOD web interface allows users to perform certain operations like start/stop, backups, restoring, monitoring, configuration files, logs...

During the first quarter of 2021 we deployed a new version of the DBOD web application in which we integrated access to CERNBox as a way of facilitating to our users the access to log files and upgrade reports.

During this talk I will explain how we integrated our service with CERNBox and the benefits that it has brought to us.
